Facts:
- In New Zealand, chronic diseases accounted for 92% of all deaths in 2002 (see chart, right).
  - Total deaths in New Zealand, 2002 = 27,000.
  - Total deaths related to chronic disease in New Zealand, 2002 = 25,000.

Note:
The data presented in this information sheet were estimated by WHO using standard methods to maximize cross-country comparability. They are not necessarily the official statistics of WHO Member States.

Chronic diseases are the major cause of death and disability worldwide.

Deaths by cause, all ages, New Zealand, 2002

- Cardiovascular disease 41%
- Cancer 27%
- Other chronic diseases 14%
- Diabetes 3%
- Communicable, maternal and perinatal, nutritional deficiencies 3%
- Injuries 5%
- Chronic respiratory disease 7%
- Injuries 5%
Projected prevalence of overweight, New Zealand, males and females aged 30 years or more, 2005 and 2015

Facts:
- Raised body mass index (overweight and obesity) is an important cause of chronic disease.
- Prevalence of overweight in New Zealand is expected to increase in both men and women over the next 10 years (see charts, left).

Solutions:
- At least 80% of premature heart disease, stroke and type 2 diabetes, and 40% of cancer could be prevented through healthy diet, regular physical activity and avoidance of tobacco products.
- Cost-effective interventions exist, and have worked in many countries: the most successful strategies have employed a range of population-wide approaches combined with interventions for individuals.
