THE IMPACT OF CHRONIC DISEASE IN INDIA

Chronic diseases are the major cause of death and disability worldwide

Facts:
- In India, chronic diseases are projected to account for 53% of all deaths (see below).
  - Total projected deaths in India, 2005 = 10,362,000.
  - Total projected deaths due to chronic disease in India, 2005 = 5,466,000.

WHO projects that over the next 10 years in India:
- Over 60 million people will die from a chronic disease.
- Deaths from infectious diseases, maternal and perinatal conditions, and nutritional deficiencies combined will decrease by 15%.
- Deaths from chronic diseases will increase by 18% - most markedly, deaths from diabetes will increase by 35%.

Note:
The data presented in this information sheet were estimated by WHO using standard methods to maximize cross-country comparability. They are not necessarily the official statistics of WHO Member States.
**Facts:**
- Raised body mass index (overweight and obesity) is an important cause of chronic disease.
- Prevalence of overweight in India is expected to increase in both men and women over the next 10 years (see below).

**Projected prevalence of overweight, India, males and females aged 30 years or more, 2005 and 2015**

**Economic impact:**
- Chronic diseases create large adverse - and underappreciated - economic effects on families, communities and countries.
- In 2005 alone, it is estimated that India will lose 9 billion dollars in national income from premature deaths due to heart disease, stroke and diabetes.
- These losses are projected to continue to increase: cumulatively, India stands to lose 237 billion dollars over the next 10 years from premature deaths due to heart disease, stroke and diabetes.\(^1\)

**Solutions:**
- At least 80% of premature heart disease, stroke and type 2 diabetes, and 40% of cancer could be prevented through healthy diet, regular physical activity and avoidance of tobacco products.
- Cost-effective interventions exist, and have worked in many countries: the most successful strategies have employed a range of population-wide approaches combined with interventions for individuals.
- WHO estimates that an additional 2% annual reduction in national-level chronic disease death rates in India over the next 10 years would result in an economic gain of 15 billion dollars for the country.

\(^1\)The estimates are reported in international dollars to account for differences in purchasing power between countries. An international dollar is a hypothetical currency that is used as a means of translating and comparing costs from one country to the other using a common reference point, the US dollar. An international dollar has the same purchasing power as the US dollar has in the United States.
