94

Unmet need for family planning (%)

Contraceptive prevalence (%)

Antenatal care coverage (%)

Births attended by skilled health personnel (%)

Births by caesarean section (%)

Postnatal care visit within two days of childbirth (%)

Neonates protected at birth against neonatal tetanus (%)

Immunization coverage among 1-year-olds (%)

Children aged 6–59 months who received vitamin A supplementation (%)

Children aged < 5 years with ARI symptoms taken to a health facility (%)

Children aged < 5 years with ARI symptoms receiving antibiotics (%)

Children aged < 5 years with diarrhoea receiving ORT (ORS and/or RHF) (%)

Children aged < 5 years sleeping under insecticide-treated nets (%)

Children aged < 5 years with fever who received treatment with any antimalarial (%)

Pregnant women with HIV receiving antiretrovirals to prevent MTCT (%)

Antiretroviral therapy coverage among people with advanced HIV infection (%)

Case-detection rate for all forms of tuberculosis (%)

Treatment-success rate for smear-positive tuberculosis (%)

5. Risk factors

107

Population using improved drinking-water sources (%)
 Population using improved sanitation (%)
 Population using solid fuels (%)
 Preterm birth rate (per 100 live births)
 Infants exclusively breastfed for the first 6 months of life (%)
 Children aged < 5 years who are wasted (%)
 Children aged < 5 years who are stunted (%)
 Children aged < 5 years who are underweight (%)
 Children aged < 5 years who are overweight (%)
 Prevalence of raised fasting blood glucose among adults aged ≥ 25 years (%)
 Prevalence of raised blood pressure among adults aged ≥ 25 years (%)
 Adults aged ≥ 20 years who are obese (%)
 Alcohol consumption among adults aged ≥ 15 years (litres of pure alcohol per person per year)
 Prevalence of smoking any tobacco product among adults aged ≥ 15 years (%)
 Prevalence of current tobacco use among adolescents aged 13–15 years (%)
 Prevalence of condom use by adults aged 15–49 years during higher-risk sex (%)
 Population aged 15–24 years with comprehensive correct knowledge of HIV/AIDS (%)

6. Health systems

118

Health workforce

Physicians (per 10 000 population)
 Nursing and midwifery personnel (per 10 000 population)
 Dentists (per 10 000 population)
 Pharmacists (per 10 000 population)
 Environment and public health professionals (per 10 000 population)
 Community health workers (per 10 000 population)
 Psychiatrists (per 10 000 population)

Infrastructure and technologies

Hospitals (per 100 000 population)
 Hospital beds (per 10 000 population)
 Psychiatric beds (per 10 000 population)
 Computed tomography units (per million population)
 Radiotherapy units (per million population)

Essential medicines

Median availability of selected generic medicines in public and private sectors (%)
 Median consumer price ratio of selected generic medicines in public and private sectors

7. Health expenditure

131

Health expenditure ratios

Total expenditure on health as a percentage of gross domestic product

General government expenditure on health as a percentage of total expenditure on health

Private expenditure on health as a percentage of total expenditure on health

General government expenditure on health as a percentage of total government expenditure

External resources for health as a percentage of total expenditure on health

Social security expenditure on health as a percentage of general government expenditure on health

Out-of-pocket expenditure as a percentage of private expenditure on health

Private prepaid plans as a percentage of private expenditure on health

Per capita health expenditures

Per capita total expenditure on health at average exchange rate (US\$)

Per capita total expenditure on health (PPP int. \$)

Per capita government expenditure on health at average exchange rate (US\$)

Per capita government expenditure on health (PPP int. \$)

8. Health inequities

143

Contraceptive prevalence: modern methods (%)

Antenatal care coverage: at least four visits (%)

Births attended by skilled health personnel (%)

DTP3 immunization coverage among 1-year-olds (%)

Children aged < 5 years who are stunted (%)

Under-five mortality rate (probability of dying by age 5 per 1000 live births)

9. Demographic and socioeconomic statistics

155

Total population (000s)

Median age of population (years)

Population aged < 15 years (%)

Population aged > 60 years (%)

Annual population growth rate (%)

Population living in urban areas (%)

Civil registration coverage (%) of births and causes of death

Crude birth rate (per 1000 population)

Crude death rate (per 1000 population)

Total fertility rate (per woman)

Adolescent fertility rate (per 1000 girls aged 15–19 years)

Literacy rate among adults aged ≥ 15 years (%)

Net primary school enrolment rate (%)

Gross national income per capita (PPP int. \$)

Population living on < \$1 (PPP int. \$) a day (%)

Cellular phone subscribers (per 100 population)

Introduction

The World Health Statistics series is WHO's annual compilation of health-related data for its 194 Member States, and includes a summary of the progress made towards achieving the health-related Millennium Development Goals (MDGs) and associated targets. This year, it also includes highlight summaries on the topics of reducing the health gaps between the world's most-advantaged and least-advantaged countries, and on current trends in official development assistance (ODA) for health.

The series is produced by the WHO Department of Health Statistics and Information Systems of the Health Systems and Innovation Cluster. As in previous years, World Health Statistics 2013 has been compiled using publications and databases produced and maintained by WHO technical programmes and regional offices. A number of demographic and socioeconomic statistics have also been derived from databases maintained by a range of other organizations. These include the United Nations International Telecommunication Union (ITU), the United Nations Department of Economic and Social Affairs (UNDESA), the United Nations Educational, Scientific and Cultural Organization (UNESCO), the United Nations Children's Fund (UNICEF) and the World Bank.

Indicators have been included on the basis of their relevance to global public health; the availability and quality of the data; and the reliability and comparability of the resulting estimates. Taken together, these indicators provide a comprehensive summary of the current status of national health and health systems in the following nine areas:

- life expectancy and mortality
- cause-specific mortality and morbidity
- selected infectious diseases
- health service coverage
- risk factors
- health systems
- health expenditure
- health inequities
- demographic and socioeconomic statistics

The estimates given in this report are derived from multiple sources, depending on each indicator and on the availability and quality of data. In many countries, statistical and health information systems are weak and the underlying empirical data may not be available or may be of poor quality. Every effort has been made to ensure the best use of country-reported data – adjusted where necessary to deal with missing values, to correct for known biases, and to maximize the comparability of the statistics across countries and over time. In addition, statistical modelling and other techniques have been used to fill data gaps.

Because of the weakness of the underlying empirical data in many countries, a number of the indicators presented here are associated with significant uncertainty. It is WHO policy to ensure statistical transparency, and to make available to users the methods of estimation and the margins of uncertainty for relevant indicators. However, to ensure readability while covering such a comprehensive range of health topics, printed versions of the World Health Statistics series do not include the margins of uncertainty which are instead made available through online WHO databases such as the Global Health Observatory.¹

While every effort has been made to maximize the comparability of the statistics across countries and over time, users are advised that country data may differ in terms of the definitions, data-collection methods, population coverage and estimation methods used. More-detailed information on indicator metadata is available in the WHO Indicator and Measurement Registry.²

WHO presents World Health Statistics 2013 as an integral part of its ongoing efforts to provide enhanced

¹ The Global Health Observatory (GHO) is WHO's portal providing access to data and analyses for monitoring the global health situation. See: <http://www.who.int/gho>, accessed 10 March 2013.

² See: http://apps.who.int/gho/indicatorregistry/App_Main/browse_indicators.aspx, accessed 10 March 2013.

access to comparable high-quality statistics on core measures of population health and national health systems. Unless otherwise stated, all estimates have been cleared following consultation with Member States and are published here as official WHO figures. However, these best estimates have been derived using standard categories and methods to enhance their cross-national comparability. As a result, they should not be regarded as the nationally endorsed statistics of Member States which may have been derived using alternative methodologies.

WORLD HEALTH STATISTICS 2013

Part I

Health-related Millennium Development Goals

Summary of status and trends

More than a decade after world leaders adopted the Millennium Development Goals (MDGs) and associated targets substantial progress has been made in reducing child and maternal mortality, improving nutrition, and reducing morbidity and mortality due to HIV infection, tuberculosis and malaria. Although progress has accelerated in recent years in many countries with the highest rates of mortality, large gaps persist both among and within countries. Nevertheless, current trends continue to provide a sound basis for intensified collective action and the expansion of successful approaches to overcome the challenges posed by multiple crises and large inequalities.

Globally, significant progress has been made in reducing levels of mortality among children under five years of age. Between 1990 and 2011, under-five mortality declined by 41% from an estimated rate of 87 to 51 deaths per 1000 live births. The global rate of decline has also accelerated in the past decade, from 1.8% per annum between 1990 and 2000 to 3.2% per annum between 2000 and 2011. The WHO Western Pacific

Region has experienced the largest reduction as well as the fastest acceleration of the decline in under-five mortality rates between 1990 and 2011 (Figure 1). Despite these successes, it is also clear that the current rates of decline remain insufficient to reach the global target of a two thirds reduction in 1990 levels of mortality by the year 2015.

At national level, 27 diverse countries have reached the MDG target ahead of 2015, including five countries that had very high child-mortality levels in 1990.³ This suggests that rapid improvements are possible in a range of settings that vary in terms of their geographical characteristics, level of economic and social development, population size and epidemiological patterns. Of the 10 countries that experienced the fastest acceleration in the reduction of child mortality, seven had reversed the trend of an increasing under-five mortality rate in the 1990s to a rapid decline in the past decade.

³. Countries with less than 500 000 population in 2011 were excluded from the analysis.

Figure 1. Relative rates of decline in under-five mortality rates, globally and by WHO region

Figure 2. Regional and global trends in maternal mortality ratio, 1990–2010

In an estimated 35% of all deaths of children under five years of age, under-nutrition⁴ is the underlying cause of death. The proportion of underweight children in developing countries declined from 28% to 17% between 1990 and 2011. Although this rate of progress is close to the rate required to meet the relevant target, significant variations persist between and within regions.

The total number of neonatal deaths decreased from 4.4 million in 1990 to 3.0 million in 2011. Neonatal mortality rates declined from 32 per 1000 live births to 22 per 1000 live births over the same period – a reduction of over 30%. This is a slower decline than for child mortality overall, and the proportion of deaths in children under five years of age that occur in the neonatal period increased from 36% in 1990 to 43% in 2011. Prematurity is the leading cause of neonatal deaths and is now the second leading cause of death in children under five years.

In 2011, global measles immunization coverage was 84% among children aged 12–23 months with 64% of WHO Member States reaching at least 90% coverage. Between 2000 and 2011, the estimated number of measles deaths decreased by 71% as more countries

achieved high levels of immunization coverage.

A substantial reduction in maternal deaths has previously been noted – from 543 000 deaths in 1990 to an estimated 287 000 by 2010, with a global rate of decline in the maternal mortality ratio of 3.1% per annum over the same period. Nevertheless, this rate of decline would now need to double in order to achieve the MDG target of reducing the maternal mortality ratio by three quarters between 1990 and 2015. All six WHO regions have seen a decline in the maternal mortality ratio, but at different rates (Figure 2). The WHO African Region remains the region with the highest maternal mortality ratio. Approximately one quarter of countries with the highest maternal mortality ratio in 1990 (100 or more maternal deaths per 100 000 live births) have made insufficient progress or none.

In order to reduce maternal deaths, women need access to good-quality reproductive health services. In 2010, 63% of women aged 15–49 years who were married or in a consensual union were using some form of contraception. Although the proportion of women receiving antenatal care at least once during pregnancy was about 81% over the period 2005–2012, the figure dropped to around 55% for the recommended minimum of four visits or more. The proportion of births attended by skilled personnel – crucial for reducing perinatal,

⁴ Including underweight, suboptimal breastfeeding, and vitamin and mineral deficiencies.

neonatal and maternal deaths – was above 90% in three of the six WHO regions for the period 2005–2012. However, in the WHO African Region coverage remains at under 50%.

About 16 million adolescent girls between 15 years and 19 years of age give birth each year. Babies born to adolescent mothers account for approximately 11% of all births worldwide – with 95% of such births occurring in developing countries. In low- and middle-income countries, complications from pregnancy and childbirth are a leading cause of death among adolescent girls in this age group, and in 2008 there were an estimated three million unsafe abortions carried out on such girls. The adverse effects of adolescent childbearing also extend to the health of the infants. Perinatal deaths are 50% higher among babies born to mothers under 20 years of age than among those born to mothers aged 20–29 years. The neonates of adolescent mothers are also more likely to have a low birth weight, which may result in a higher rate of long-term health risks.

About half the world's population is at risk of contracting malaria, and an estimated 219 million cases of malaria

led to 660 000 deaths in 2010. Country-level malaria estimates available for 2010 show that approximately 80% of estimated cases occur in 17 countries with 80% of estimated malaria deaths occurring in just 14 countries. The coverage of interventions such as the distribution of insecticide-treated nets and indoor residual spraying has greatly increased, and needs to be sustained in order to prevent the resurgence of disease and deaths.

The annual global number of new cases of tuberculosis has been slowly declining since 2006, and between 2010 and 2011 the number of such cases fell by 2.2%. Of the estimated 8.7 million new cases in 2011, about 13% involved people living with HIV. In all six WHO regions the incidence of tuberculosis is falling (Figure 3).⁵ For the four years up to and including 2010, the global treatment-success rate has met or exceeded the target of 85% first set by the World Health Assem-

⁵ From: *Global Tuberculosis Report 2012*. Geneva, World Health Organization, 2012. See: http://www.who.int/tb/publications/global_report/. Shaded areas indicate uncertainty bands.

Figure 3. Estimated tuberculosis incidence rates by WHO region, 1990–2011

bly in 1991. Mortality due to tuberculosis has also fallen by 41% since 1990 and the world is on track to reach a 50% reduction by 2015.

The 2011 global estimate of 34 million people living with HIV represents an increase on previous years. As access to antiretroviral therapy in low- and middle-income countries improves (8 million people in such countries received treatment in 2011) it is expected that the population living with HIV will continue to grow as fewer people die from AIDS-related causes. In 2011, an estimated 2.5 million people worldwide were newly infected with HIV – over 20% less than the 3.2 million people newly infected in 2001. During the same year, an estimated 1.7 million people died from AIDS-related causes worldwide – 24% less than in 2005. Approximately 69% of all those living with HIV are in sub-Saharan Africa with the same region accounting for 70% of all deaths from AIDS-related causes in 2011 (Figure 4).

The term “neglected tropical diseases” refers to a group of 17 diseases that affect more than one billion people worldwide.⁶ Although these diseases rarely cause outbreaks (with the exception of dengue and leishmaniasis), they thrive in the poorest and most marginalized communities, causing severe pain, permanent disability and death to millions of people. Some of these diseases are in decline. Dracunculiasis, for example, is on the verge of eradication, and the reported number of new cases of the chronic form of human African trypanosomiasis (caused by *Trypanosoma brucei gambiense*) fell by 76% between 1999 and 2011. However, the incidence of dengue has grown dramatically around the world in recent decades. Current estimates suggest there may be 50–100 million dengue infections worldwide every year.

MDG target 7.C calls for the proportion of the global population without sustainable access to safe drinking-water and basic sanitation to be halved by 2015 using

1990 as the baseline year. Since 2000, the progress made in achieving this target has been monitored biennially by the WHO/UNICEF Joint Monitoring Programme (JMP) for Water Supply and Sanitation⁷ using two indicators disaggregated for urban and rural settings: (i) the proportion of the population that uses an improved source of drinking-water; and (ii) the proportion of the population that uses an improved sanitation facility. On the basis of these indicators, the JMP announced in its 2012 progress report that the drinking-water target had been met in 2010 when an estimated 89% of the world's population used an improved source of drinking-water compared with 76% in 1990. Despite this impressive progress, significant disparities remain between regions (Figure 5). The coverage levels of at least 90% recorded in four of the six WHO regions have not yet been achieved in the WHO African Region and the WHO Eastern Mediterranean Region. Based on the current rate of progress, these two regions will fall short of the 2015 target.

Beyond the regional and national averages, an even starker story unfolds when comparing the richest wealth quintiles to the poorest wealth quintiles of households in both urban and rural settings in unserved regions. Analysis of data from 35 countries in sub-Saharan Africa has shown that over 90% of the richest quintile in urban areas uses improved drinking-water sources compared with just over 60% of the poorest household quintile. In rural areas, the situation is even worse with such improved sources only available to one third of the poorest households (Figure 6).⁸

With regard to basic sanitation, Figure 5 highlights the ongoing slow rate of progress, with the present rate of improvement unlikely to result in the MDG target being met by 2015 globally. Even though almost 1.9 billion people have gained access to improved sanitation facilities since 1990, global coverage is currently estimated at just 64%. In 2011, more than one third of the global population (2.5 billion people) still lacked access to improved sanitation facilities.

⁶ The diseases concerned are: Buruli ulcer; Chagas disease; cysticercosis; dengue; dracunculiasis; echinococcosis; endemic treponematoses; foodborne trematode infections; human African trypanosomiasis; leishmaniasis; leprosy; lymphatic filariasis, onchocerciasis; rabies; schistosomiasis; soil-transmitted helminthiasis; and trachoma. The term “billion” is used here and throughout this document to mean a thousand million (10⁹).

Figure 6. Proportion of population using improved drinking-water sources by wealth quintile – urban and rural residence, sub-Saharan Africa

Many people continue to face a scarcity of medicines in the public sector, forcing them to the private sector where prices can be substantially higher. Surveys undertaken from 2007 to 2012 indicated that the average availability of selected generic medicines in the public sector in low- and middle-income countries was only 57%. The price to patients of the lowest-priced generics in the private sector averaged five times the international reference prices, ranging up to about 16 times higher in some countries. Even the cost of the lowest-priced generics can put common treatments beyond the reach of low-income households in developing countries. The greatest price is paid by patients suffering chronic diseases. Even though

effective treatments exist for the majority of conditions contributing to the global burden of chronic disease, universal access remains out of reach.

Given the very short time which now remains before the end of 2015, it is becoming ever more apparent that, despite the significant progress made, much will need to be done if the health-related MDGs are to be achieved. At the same time, great efforts will also be needed well beyond 2015 as the world faces up to the new challenges to be faced in sustaining and measuring meaningful progress, for example in the areas of ensuring access to safe drinking-water and basic sanitation (Box 1).

Box 1: Gearing up for the post-2015 challenges – drinking-water and basic sanitation

The original indicator for drinking-water quality used by the JMP on the recommendation of the United Nations General Assembly was the only globally viable proxy indicator available when MDG monitoring started. It was assumed that the application of the technology-based definition of “improved sources” of drinking-water directly implied a high probability of good drinking-water quality. Testing drinking-water quality more directly in a way that was in line with JMP methods and procedures for collecting data through nationally representative household surveys was not a feasible option. Even today, the option of measuring drinking-water quality in the context of household surveys is only beginning to emerge.

The resulting lack of correlation between the target (“safe” drinking-water) and the indicator (improved sources) was investigated through JMP pilot studies in five countries in 2004–2006.⁹ Rapid assessments of drinking-water quality showed that the improved sources studied varied in the degree to which they accorded with WHO guidance in relation to microbial and chemical contamination,¹⁰ and seldom achieved 100% accordance. As a result, improved sources cannot be equated with safe and clean drinking-water.

The unrelenting lack of sufficient progress in relation to access to basic sanitation has stimulated a renewed focus on this issue. Recent initiatives include the “Sustainable Sanitation: five-year drive to 2015” officially launched by the Secretary-General of the United Nations in June 2011. A vitally important aspect

of global sanitation monitoring remains the assessment of “shared” sanitation – defined as improved sanitation that is shared between households. In many countries, a trend towards shared sanitation has accelerated rapidly, especially in urban areas. However, while shared sanitation offers governments an efficient way of expanding basic sanitation coverage levels, there are no clear criteria to distinguish between shared and public sanitation; with the latter considered to be unimproved. This issue is high on the JMP agenda and is currently the subject of a research programme. This programme will directly address the question of whether shared sanitation is indeed equivalent to improved sanitation facilities for individual households in terms of limiting the level of health risk, and will identify the health-risk criteria needed to effectively distinguish it from public sanitation.

In view of these realities, WHO and UNICEF have provided a platform, through the JMP, to develop evidence-based drinking-water, sanitation and hygiene targets and indicators as a contribution towards work on the post-2015 development agenda.¹¹ Through consultative efforts, a post-2015 global monitoring framework is being developed. Building on existing monitoring systems, this framework will bring on board human-rights considerations, extend monitoring beyond households (for example, to schools and health-care centres), and will consider not only basic access but also the attainment of higher service levels – all with a view to realize the vision of universal coverage.

Regional and country charts

Following the global and WHO regional summary shown in Figure 7, charts 1–13 provide country-by-country summaries¹² of national trends in MDG indicators for which data are available.

Depending on the availability of data for each indicator, there are two types of chart:

Chart type I

For six indicators – under-five mortality rate; maternal mortality ratio; HIV prevalence; tuberculosis mortality rate; population without access to improved drinking-water sources; and population without access to improved sanitation – the charts show the average annual rate of decline (AARD) since 1990 up to the latest available year (or for the year range indicated), and the overall AARD required for the country to achieve the relevant MDG by 2015. The country figures show data for the latest available year.

Chart type II

For seven indicators – measles immunization coverage among 1-year-olds; births attended by skilled health personnel; antenatal care coverage; unmet need for family planning; antiretroviral therapy coverage among people with advanced HIV infection; children aged < 5 years sleeping under insecticide-treated nets; and children aged < 5 years with fever who received treatment with any antimalarial – the charts show only data for the latest available year, along with an indication of a WHO or partner agency target.

... indicates data not available or not applicable.

Further details can be found in the country tables shown in **Part III** as indicated below each chart.

¹² South Sudan became an independent state in July 2011 and a WHO Member State in September 2011. As the reported data shown here concern time periods before and after 2011, the term “Sudan (former)” refers to the state as it existed prior to July 2011 and is listed among the Member States.

Figure 7. Global and WHO Regional progress toward the achievement of health-related MDGs

Target 1.C Halve, between 1990 and 2015, the proportion of people who suffer from hunger

Target 4.A Reduce by two-thirds, between 1990 and 2015, the under-five mortality rate

Target 5.A Reduce by three quarters, between 1990 and 2015, the maternal mortality ratio

Target 5.B Achieve, by 2015, universal access to reproductive health

Target 6.A Have halted by 2015 and begun to reverse the spread of HIV/AIDS

Target 6.B Achieve, by 2010, universal access to treatment for HIV/AIDS for all those who need it

Target 6.C Have halted by 2015 and begun to reverse the incidence of malaria and other major diseases

Target 7.C Halve, by 2015, the proportion of people without sustainable access to safe drinking-water

Key

■ On track ■ Insufficient progress

Grey horizontal lines indicate either the MDG (where available) or relevant WHO or partner agency target. For more details, see the relevant country charts. For the AARD (%) in proportion of underweight children under five years of age (1990–2011) and the AARD (%) in the incidence of malaria (2000–2010), see **Part III, Table 5** and the *World Malaria Report 2011* respectively for more details.

1 | AARD (%) in under-five mortality rate, 1990–2011

The under-five mortality rate is defined as the probability of dying by age 5 expressed as the total number of such deaths per 1000 live births. Within each WHO region, countries are sorted in descending order based on the AARD in this rate.

In order to reach the MDG target of reducing by two thirds the under-five mortality rate between 1990 and 2015, an AARD of 4.3% is needed and this is denoted by the vertical line. The numerical values show the estimated under-five mortality rate in each country in 2011. For countries with low levels of under-five mortality, the target AARD may not be applicable.

Further details may be found in **Part III, Table 1**.

2 Measles immunization coverage among 1-year-olds (%)

WORLD HEALTH
STATISTICS
2013

This chart shows the percentage of 1-year-olds fully immunized against measles. Within each WHO region, countries are sorted by the 2011 level. The vertical line denotes the target of 90% coverage by 2015 set at the 2010 World Health Assembly. Further details may be found in **Part III, Table 4**.

3 | AARD (%) in maternal mortality ratio, 1990–2010

The maternal mortality ratio is defined as the number of maternal deaths per 100 000 live births. Within each WHO region, countries are sorted in descending order based on the AARD in this ratio. Unrounded values have been used to calculate the AARD.

In order to reach the MDG target of reducing the maternal mortality ratio by three quarters between 1990 and 2015, an AARD of 5.5% is needed and this is denoted by the vertical line. The numerical values show the estimated maternal mortality ratio for 2010. For countries with low levels of maternal mortality, the target AARD may not be applicable.

Further details may be found in **Part III, Table 2**.

4 Births attended by skilled health personnel (%)

WORLD HEALTH
STATISTICS
2013

This chart shows the percentage of births attended by skilled health personnel. Within each WHO region, countries are sorted by the latest available data since 2005.

The vertical line denotes the global target of 90% coverage by 2015 set by the International Conference on Population and Development (ICPD+5).

Further details may be found in **Part III, Table 4**.

5 Antenatal care coverage (%): at least one visit and at least four visits

This chart shows the percentage of women who received antenatal care from skilled health personnel at least once and at least four times during pregnancy. Within each WHO region, countries are sorted by the latest available data since 2005 for at least one visit.

The vertical line denotes the global target of 100% coverage by 2015 set by the International Conference on Population and Development (ICPD+5).

Further details may be found in **Part III, Table 4**.

■ At least one visit
■ At least four visits

6 | Unmet need for family planning (%)

WORLD HEALTH
STATISTICS
2013

This chart shows the percentage of women who are fecund and sexually active but want to stop or delay childbearing and are not using any method of contraception. Within each WHO region, countries are sorted by the latest available data since 2005.

Achieving the MDG target of universal access to reproductive health by 2015 can be interpreted as 0% unmet need. The vertical line corresponds to 0% with the percentage of unmet need shown to the left of this line with a range of 50%.

Further details may be found in **Part III, Table 4**.

7 | AARD (%) in HIV prevalence, 2001–2011

This chart shows the AARD in the estimated prevalence of HIV infections per 100 000 population per year for the period 2001–2011. Within each WHO region, countries are sorted in descending order based on the AARD in this rate.

The MDG target to halt by 2015 and begin to reverse the spread of HIV/AIDS can be interpreted as any AARD greater than 0%. The vertical line corresponds to an AARD of 0% with cut-off points of $\pm 10\%$ on either side. Grey bars indicate countries in which the AARD was less than -10% . The numerical values show estimated HIV prevalence per 100 000 population for 2011.

Further details may be found in **Part III, Table 2**.

8 Antiretroviral therapy coverage among people with advanced HIV infection (%)

WORLD HEALTH
STATISTICS
2013

This chart shows estimated antiretroviral therapy coverage in 2011 based on the standards for treatment set out in the 2010 guidelines of the Joint United Nations Programme on HIV/AIDS. Within each WHO region, countries are sorted in descending order by the level of coverage achieved.

The vertical line denotes the target of universal access to antiretroviral therapy, defined as providing antiretroviral therapy to at least 80% of patients in need.

Further details may be found in **Part III, Table 4**.

9 Children aged <5 years sleeping under insecticide-treated nets (%)

This chart shows the percentage of children under 5 years old that slept under an insecticide-treated net the night prior to the survey. Within each WHO region, countries are sorted by the latest available data since 2005.

The vertical line denotes the target of 80% coverage set by WHO and the Roll Back Malaria Partnership.

Further details may be found in **Part III, Table 4**.

10 Children aged <5 years with fever who received treatment with any antimalarial (%)

WORLD HEALTH
STATISTICS
2013

This chart shows the percentage of children under 5 years old with fever in the two weeks prior to the survey who received any antimalarial medicine. Within each WHO region, countries are sorted by the latest available data since 2005.

The vertical line denotes the target of 100% coverage set by WHO and the Roll Back Malaria Partnership.

Further details may be found in **Part III, Table 4**.

11 | AARD (%) in tuberculosis mortality rate, 1990–2011

This chart shows the AARD in the estimated tuberculosis mortality rate per 100 000 population (excluding deaths among HIV-positive people) for the period 1990–2011. Within each WHO region, countries are sorted in descending order based on the AARD in estimated tuberculosis mortality rates.

In order to reach the target of a 50% reduction between 1990 and 2015 set by the Stop TB Partnership, an AARD of 2.7% is needed and this is denoted by the vertical line. The numerical values shown are estimated tuberculosis mortality rates per 100 000 population in 2011. For countries with small populations, the AARD may not be applicable and only the 2011 estimated mortality rate is shown.

Further details may be found in **Part III, Table 2**.

12 | AARD (%) in proportion of population without access to improved drinking-water sources

WORLD HEALTH
STATISTICS
2013

The AARD in the proportion of the population without access to improved drinking-water sources was calculated using the complement of the estimated proportion using an improved drinking-water source, for the period 1990–2011 (or any minimum period of five years since 1990). Within each WHO region, countries are sorted in descending order based on this rate of decline.

In order to reach the MDG target of halving, by 2015, the proportion of people without sustainable access to safe drinking-water, an AARD of 2.7% will be required and is denoted by the vertical line. Countries with sustained low levels of proportion of population without improved drinking-water sources (< 2%) can be considered to have met the target and are shown with the maximum AARD at the beginning of their respective regional listing. The numerical values show the estimated percentage of the population not using improved drinking-water sources in 2011.

Further details may be found in **Part III, Table 5**.

13 | AARD (%) in proportion of population without access to improved sanitation

The AARD in the proportion of the population without access to improved sanitation was calculated using the complement of the estimated proportion using improved sanitation, for the period 1990–2011 (or any minimum period of five years since 1990). Within each WHO region, countries are sorted in descending order based on this rate of decline.

In order to reach the MDG target of halving, by 2015, the proportion of people without sustainable access to basic sanitation, an AARD of 2.7% will be required and is denoted by the vertical line. Countries with sustained low levels of proportion of population without improved sanitation (< 2%) can be considered to have met the target and are shown with the maximum AARD at the beginning of their respective regional listing. The numerical values show the estimated percentage of the population not using improved sanitation in 2011.

Further details may be found in **Part III, Table 5**.

WORLD HEALTH STATISTICS 2013

Part II

Highlighted topics

Are efforts to meet the MDGs reducing health gaps between countries?

The Millennium Declaration agreed on by world leaders in September 2000¹³ upholds equity as one of the fundamental principles of progress. With their focus on improving the situation in the world's poorest countries and reducing unacceptable global health disparities, it is timely to ask if efforts to meet the MDGs have resulted in a significant reduction in health gaps between countries.

One way to assess convergence is to compare the gaps that existed between those countries with the best health status and those with least-favourable health status at the MDG baseline year of 1990 and again two decades later. Figure 8 shows the average values for the "top" 25% of countries with the corresponding values for the "bottom" 25% of countries for selected indicators.¹⁴ In absolute terms, the dramatic progress made in the bottom 25% of countries over two decades is clear, as is the narrowing of the gaps between the top and bottom categories.

For example, the absolute gap in the under-five mortality rate between the top and bottom countries fell from 171 deaths per 1000 live births in 1990 to 107 per 1000 live births in 2011. Some countries who were in the bottom category in 1990 – including Bangladesh, Bhutan, Lao People's Democratic Republic, Madagascar, Nepal, Rwanda, Senegal and Timor-Leste – reduced their under-five mortality rates to such an extent that by 2011 they no longer belonged to that group. However, when considering relative reduction over time, it is also clear that while the average under-five mortality rate in the top

countries declined by 60% between 1990 and 2011, the bottom countries only experienced a 39% decline over the same period. In other words, the relative rate of decline was larger in countries that already had the lowest levels of under-five mortality.

In 1990, countries in the bottom category had on average 915 more maternal deaths per 100 000 live births compared to countries in the top category. In 2010, this had narrowed to 512 per 100 000 live births. However, the relative decline in the average maternal mortality ratio between 1990 and 2010 in the bottom 25% of countries was 44% – only marginally higher than the 34% decline observed in the top 25% of countries.

The difference in HIV incidence rate (the number of people newly infected with HIV per 100 000 population) between the 25% of countries with the highest rate and the 25% of countries with the lowest rate was 360 in 1990. In 2011, this gap fell to 261 (Figure 8). In the group of countries with the lowest rates, the average incidence of HIV cases increased six-fold between 1990 and 2011 (from 0.5 to 3 per 100 000 population). Over the same period, the average HIV incidence rate in the group of countries with the highest rates declined by 27% (from 361 to 264 per 100 000 population).

Globally, the tuberculosis mortality rate has decreased by 41% since 1990 and the trend indicates that it will reach a 50% reduction by 2015. The absolute gap between the average tuberculosis mortality rates in the top and bottom 25% of countries has narrowed, from 62 per 100 000 population in 1990 to 41 per 100 000 population in 2011 (Figure 8). However, over this same period the 34% relative decline in the bottom 25% of countries was under half of the relative decline of 70% observed in the top 25% of countries.

The prevalence of underweight children was virtually negligible in richer countries in 1990, and this has re-

¹³ See: <http://www.un.org/millennium/declaration/ares552e.htm>

¹⁴ For each indicator, the top and bottom 25% of all available countries were selected based on performance. Countries with less than 500 000 population in 2011 were excluded from the analysis, with each remaining country assigned equal "weight" regardless of population. Depending on data availability, there were between 31 and 41 countries in each group. The countries in the top and bottom categories may not be the same for the two years shown.

Figure 8. Measuring convergence between the world's most-advantaged and least-advantaged countries using selected MDG indicators

^a Chart denotes average proportion of population who are not using improved sources of drinking-water or improved sanitation facilities.

mained the case in the last two decades. By contrast, in 1990 the 25% of countries with the highest prevalence averaged 32 underweight children in every 100 children under five years of age (Figure 8). In 2011, this declined to 24 for every 1000 children under five years of age, representing a 24% decline.¹⁵

Almost everyone in the top 25% of countries has access to improved drinking-water sources and improved sanitation facilities, and has done so since 1990. As a result, the average proportion of the population in such countries not using improved drinking-water sources or improved sanitation is 0% for both of these indicators. Between 1990 and 2011, the absolute gap between the average proportion of the population not using improved drinking-water sources in the top 25% and bottom 25% of countries declined from 55% to 37% (Figure 8). The absolute gap between the average proportion of the population not using improved sanitation facilities in the top 25% and bottom 25% of countries also declined – from 85% in 1990 to 75% in 2011. Over this same period, the relative decline in the bottom 25% of countries was 33% and 12% for the average proportion of population not using improved drinking-water sources and the average proportion of the population not using improved sanitation facilities, respectively.

Concerted actions to achieve the MDGs have clearly brought about improvements across a range of global health indicators and associated health outcomes, with evidence of convergence – at least in absolute terms – between the most-advantaged and least-advantaged countries of the world. The situation, however, remains far from satisfactory as large gaps persist between countries. In addition, there exist gaps within countries that are concealed when only national averages are considered (see **Part III, Table 8** on health inequities). With only two years remaining before the MDG deadline of 2015, convergence between the world's most-

advantaged and least-advantaged populations needs to be accelerated.

¹⁵ Analysis using data from: Stevens GA et al. Nutrition Impact Model Study Group (Child Growth). Trends in mild, moderate, and severe stunting and underweight, and progress towards MDG 1 in 141 developing countries: a systematic analysis of population representative data. *Lancet*, 2012 Sep 1, 380(9844):824–834. doi: 10.1016/S0140-6736(12)60647-3. Epub 2012 Jul 5.

Official development assistance for health

The United Nations Millennium Declaration in 2000 embodies an international commitment to create an environment conducive to development and to the elimination of poverty. MDG 8 addresses the issue of global partnerships for development, with target 8.B specifically calling for more-generous contributions of official development assistance (ODA) for countries committed to poverty reduction.

ODA for health is, however, only one aspect of the broader concept of Development Assistance for Health (DAH). Specifically, ODA involves the flow of financing from donor governmental sources to promote economic development and welfare in recipient countries, with a grant component of at least 25%. In addition to the bilateral ODA reported by countries to the Organisation for Economic Cooperation and Development (OECD) each year, the OECD Development Assistance Committee (DAC)¹⁶ also collates information on budget flows originating from bilateral donors but channelled through multilateral organizations such as the World Bank, the GAVI Alliance and the Global Fund as ODA. The remaining and growing share of DAH then comes from the private sector, including nongovernmental organizations (NGOs) and foundations such as the Bill and Melinda Gates Foundation.

The Millennium Declaration heralded a substantial increase in ODA for health. Of the several data series of ODA flows made available by OECD, the most relevant for health are:

- donor commitments¹⁷ or formal promises recorded in the year they are made;

- disbursements¹⁸ as reported by donors each year though not necessarily intended to be spent in that year (a more or less complete series since 2002);
- country programmable aid (CPA) – a subset of ODA disbursements that donors report that recipient countries can plan on and spend at country level (starting in 2004).

Between 2002 and 2011, disbursements of ODA for health reported to OECD rose from US\$ 6.2 billion to US\$ 18.4 billion (Figure 9).¹⁹ The proportion donors reported as intended for low-income countries also increased from 31% to 43% – a four-fold increase in absolute terms. The value of disbursements for use by countries in the WHO African Region is estimated to have increased 4.5 times, from US\$ 1.85 billion in 2002 to US\$ 8.3 billion in 2011. This substantial increase is also probably an underestimate because:

- a proportion of the ODA that donors did not show as being linked to a particular country (for example, for global or cross-national activities) would nevertheless have benefited the African region;
- some countries – including Brazil, China, India, Russia and South Africa – do not report their aid spending to OECD;

¹⁶ For further information on the OECD DAC, see: <http://www.oecd.org/dac/>

¹⁷ A “commitment” can be defined as a firm obligation, expressed in writing and backed by the necessary funds. For more details see: <http://www.oecd.org/dac/dacglossaryofkeytermsandconcepts.htm>

¹⁸ “Disbursement” refers to the release of funds to, or the purchase of goods or services for, a recipient. They record the actual international transfer of resources or of goods or services valued at the cost to the donor. For more details see: <http://www.oecd.org/dac/dacglossaryofkeytermsandconcepts.htm>

¹⁹ To ensure comparability between different years and currencies, the volume of flows is presented in constant prices and exchange rates, with 2010 used as the reference year. This means that adjustments have been made to cover: (a) inflation in the donor’s currency between the year in question and the reference year; and (b) changes in the exchange rate between that currency and the United States dollar over the same period. See: http://www.oecd.org/dac/dacglossaryofkeytermsandconcepts.htm#Constant_Dollars

Figure 9. ODA disbursements for health as reported to OECD, 2002–2011

■ in several countries, donors also provided general budget support, part of which would typically have been allocated by recipient countries to health.

In addition, these ODA figures underestimate the overall increases in external assistance for health because they do not include funding originating from foundations such as the Bill and Melinda Gates Foundation; funding that has increased substantially in recent years.²⁰

disbursed to the implementing institution are often spent in the country beyond the year in which they were disbursed by the donor.

As these disbursements also include donor-country funding to cover the cost of aspects such as their own administration activities in relation to a recipient country, they do not necessarily equate with the money available for countries to spend in the year in which they are recorded. The only way to track how much funding from

ODA disbursements and health spending in recipient countries

The OECD Creditor Reporting System (CRS) database²¹ lists all the reported aid activities to recipients of ODA funds. Table 1 shows the top 10 recipients in 2011 in terms of aid per capita disbursed by donors to the implementing agents (such as governments, national or international NGOs and international organizations) for countries with a population of over one million. Funds

Table 1. The top 10 recipient countries in terms of ODA for health per capita, 2011

Country	Disbursements per capita (constant 2010 US\$)
Swaziland	59.2
Lesotho	42.0
Namibia	40.8
Botswana	37.9
Zambia	30.7
Rwanda	28.0
Haiti	23.5
Timor-Leste	21.5
Malawi	20.5
Liberia	20.4

²⁰ The proportion of DAH captured by OECD is not known exactly, but a recent report by the Institute for Health Metrics and Evaluation (IHME) suggests that it is now around 70% having been lower in previous years. For more details see: <http://www.healthmetricsandevaluation.org/publications/policy-report/financing-global-health-2012-end-golden-age>

²¹ See: <http://stats.oecd.org/index.aspx?DataSetCode=CRS1>

Figure 10. Health expenditures and ODA disbursements per capita for health in low-income countries, 2000–2010

external sources such as ODA is spent in the recipient country to improve health is through national health accounts.

The WHO Global Health Expenditure Database²² reports total health spending in all WHO Member States from all sources, domestic and external and is summarized in the World Health Statistics series (see **Part III, Table 7**). External sources include all forms of DAH including ODA. In low-income countries taken as a group, total health expenditure increased from US\$ 13.0 per capita in 2000 to US\$ 33.7 per capita in 2010 (Figure 10).²³ Just over one-third of this increase came from external funds or DAH, which more than quadrupled over the same period, from US\$ 2.1 per capita to US\$ 9.5 per capita. The amount of external funding that countries spend in a year is, in most cases, lower than the ODA disbursements reported by OECD, even taking into account delays in spending. The difference between the two figures can be partly explained by high overheads and transaction costs in delivering ODA. Nevertheless, the rate of increase in this funding has also been impressive, exceeding the rate of increase in funding from domestic sources. Despite this, external funding in absolute terms accounted for only US\$ 7.4 per capita

of the additional US\$ 20.7 per capita spent on health in low-income countries as a group – the remaining US\$ 13.3 deriving from domestic funds.

The average level of spending in low-income countries in 2010 – US\$ 33.7 per capita – is still well below the minimum amount of US\$ 44 per capita required to ensure that everyone can have access to a set of essential health services as suggested by the Taskforce on Innovative International Financing for Health Systems.²⁴ In addition, many other low- and middle-income countries are facing severe financial constraints, and their capacity to increase the availability and quality of health services over time will depend on their ability to increase both domestic and external funding, and to use them efficiently and equitably.

Is ODA falling?

There is increasing concern that the global financial crisis and subsequent economic recessions in high-income

²² For more information see: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>

²³ Values are unweighted averages and expressed in current United States dollars.

See: http://www.internationalhealthpartnership.net/fileadmin/uploads/ihp/Documents/Results_Evidence/HAE_results_lessons/WORKING%20GROUP%201%20REPORT%20-%20Constraints%20to%20Scaling%20Up%20and%20Costs.pdf

Figure 11. ODA commitments and disbursements for health reported to OECD, 2002–2011

Figure 12. ODA disaggregated by health purpose

countries that are the traditional bilateral donors will lead to reduced levels of ODA. Following annual increases up to 2009, ODA commitments for health have decreased despite a continued increase in disbursements (Figure 11). Although disturbing, it is not yet clear whether this will mean a decline in the funding available to recipient countries to spend on improving health. It is hoped that the level of such funding arriving in low-income countries will not falter, with increasing flows from foundations and from non-traditional bilateral donors such as Brazil, China, India and the Gulf States potentially offsetting any falls observed in traditional funding flows.

Most ODA goes to MDG 6

OECD encourages donors reporting their aid flows to identify which area of health (“health purpose”) they target. However, this is done using only one “tag”. These OECD tags have been aggregated into the four categories shown in Figure 12. From 2002 to 2011, ODA disbursements for MDG 6 increased more than five-fold, from US\$ 1.9 billion in 2002 to US\$ 10.6 billion in 2011. During the period 2009–2011, MDG 6 accounted for 58% of all ODA for health disbursed globally (excluding budget support) with only 10% of

ODA for health allocated for reproductive health and family planning aspects of MDG 5 funding; 11% to health policy, administration and management; and 21% to other health purposes (which includes all other health problems). Once again, this does not mean that the money countries received to spend on MDG 6 activities increased by the same amounts, as this can only be tracked at the country level. Although many countries are now working to disaggregate their health spending by targeted health problem – particularly for women's and children's health – the results of this and the links between increased spending and improved health will be available only over the next few years. Such efforts have been boosted by activities such as the Global Strategy for Women's and Children's Health developed following the United Nations summit on the MDGs in 2010, the Commission on Information and Accountability for Women's and Children's Health, and by the growing emphasis on making development cooperation more effective by engaging in country health-planning processes and supporting efforts such as the International Health Partnership.²⁵

WORLD HEALTH STATISTICS 2013

Part III

Global health indicators

General notes

The following summary tables represent the best estimates of WHO for a broad range of key public health indicators – based on evidence available in 2012. These best estimates have wherever possible been computed by WHO using standardized categories and methods in order to enhance cross-national comparability. This approach may result in some cases in differences between the estimates presented here and the official national statistics prepared and endorsed by individual Member States.²⁶

It is also important to stress that these estimates are subject to considerable uncertainty, especially for countries with weak statistical and health information systems where the quality of underlying empirical data is limited.

For indicators with a reference period expressed as a range in Tables 4, 5, 6 and 9, figures refer to the latest available year in the range unless otherwise noted. For survey data, the year of the report is used to determine the latest available year to be consistent across indicators. For more information on specific years, indicator definitions and metadata, please refer to: <http://www.who.int/gho>

... indicates data not available or not applicable.

The WHO regional, income-group and global aggregates for rates and ratios are weighted averages when relevant, while for absolute numbers they are the sums. Aggregates are calculated only if data are available for at least 50% of the population within an indicated group. Income-group aggregates are calculated using the 2012 World Bank list of economies²⁷ unless otherwise noted.

²⁶ South Sudan became an independent state in July 2011 and a WHO Member State in September 2011. As the reported data shown here concern time periods before and after 2011, the term “Sudan (former)” refers to the state as it existed prior to July 2011 and is listed among the Member States.

²⁷ *World Bank list of economies* (July 2012). Washington, DC, World Bank, 2012. See: <http://siteresources.worldbank.org/DATASTATISTICS/Resources/CLASS.XLS>.

1. Life expectancy and mortality

The indicators of life expectancy and mortality presented in Table 1 are: life expectancy at birth; life expectancy at age 60; stillbirth (fetal death) rate; neonatal mortality rate (the probability of death occurring during the first 28 days of life); infant and under-five mortality rates (the probability of dying between birth and 1 and 5 years of age, respectively); and adult mortality rate (the probability of dying between 15 and 60 years of age). Monitoring levels in child mortality has largely focused on liveborn infants with stillbirths often overlooked and underestimated. However, one third of all stillbirths occur during delivery from complications that can be avoided with appropriate care. Levels and trends for child mortality are also particularly relevant in understanding public health trends, with almost 20% of all deaths occurring among children less than 5 years old. The estimates of mortality presented here have been derived wherever possible from death-registration data reported annually to WHO. For countries where such data are not available or are of poor quality, household surveys and censuses are used to prepare estimates of mortality rates and life expectancy.

In the case of child mortality, WHO is part of the Inter-agency Group for Child Mortality Estimation (IGME) which carries out annual updates of estimates for infant and child mortality for UNICEF, WHO and other international agencies. As well as harmonizing the child mortality estimates used by its members, the IGME monitors progress towards the achievement of the relevant MDG target.²⁸

²⁸ MDG 4; Target 4.A: Reduce by two thirds, between 1990 and 2015, the under-five mortality rate.

2. Cause-specific mortality and morbidity

Table 2 brings together indicators on the levels and distribution of the broad categories and more-specific causes of deaths. The three broad categories shown are communicable and noncommunicable conditions, and deaths caused by injury. Estimates are also provided of the number of deaths among children under 5 years old, and the percentage distributions of the major causes of such deaths. These causes include: HIV/AIDS, diarrhoea; other major communicable diseases such as measles, malaria and pneumonia; conditions arising in the perinatal period such as prematurity, birth asphyxia, neonatal sepsis and congenital anomalies; and deaths caused by other diseases and by injury. Estimates are also given of age-standardized all-cause mortality rates among adults aged 30–70 years and of the numbers of such deaths caused by cancer, cardiovascular disease and diabetes, and chronic respiratory conditions. Table 2 also includes point estimates for key MDG-related indicators, including maternal mortality, and mortality and morbidity caused by HIV/AIDS, malaria and tuberculosis.

The cause-specific indicators presented in Table 2 have been derived from a range of sources of mortality, incidence and prevalence data. These include: death-registration records; health-facility reports; household surveys; censuses; and special studies on deaths due to HIV and to conflict. Estimating cause-specific mortality is particularly difficult in developing countries where systems for counting deaths and accurately recording their causes are weak or non-existent. Due to resulting limitations in data availability, quality and timeliness, many of the indicators shown are associated with significant uncertainty, the margins of which are available on the Global Health Observatory web site (<http://www.who.int/gho>).

2. Cause-specific mortality and morbidity

Member State	Age-standardized mortality rates by cause ^a (per 100 000 population)			Number of deaths among children aged < 5 years ^b (000s)		Mortality Distribution of causes of death among children aged < 5 years ^b (%)

3. Selected infectious diseases

Table 3 has been compiled from official national reports of case numbers for selected infectious diseases. Decisions on which diseases to include have primarily been made on the basis of data availability. Where possible, a distinction is made between zero cases reported and no information available for a country. In isolation, the numbers shown provide no indication of the relative risk of disease, nor of the quality of disease reporting in different countries. However, the table does provide an indication of the current status of officially reported infectious disease data at the global level, and of the major reporting gaps. Given the variations in the methods used by countries to obtain these numbers, no attempt has been made to calculate incidence or prevalence.

To meaningfully interpret the figures provided, both epidemiological patterns and data-collection efforts in specific countries must be considered. Some diseases (for example, malaria and yellow fever) are endemic to certain geographical regions, but are extremely rare elsewhere. Diseases such as plague are liable to cause outbreaks that can cause case numbers to fluctuate widely over time. Because some diseases are best tackled with preventive measures such as mass drug treatment, reporting the number of cases is a lower priority than estimating the population at risk. For vaccine-preventable diseases, case numbers are affected by immunization rates. Diseases such as H5N1 influenza, Japanese encephalitis and malaria are difficult to identify without specialized laboratory tests that are often not available in developing countries. In many settings, cases of some diseases are identified through clinical signs and symptoms alone.

Despite ongoing efforts to enhance disease surveillance and response, many countries face challenges in accurately identifying, diagnosing and reporting infectious diseases due to the remoteness of communities, lack of transport and communication infrastructures, and a shortage of skilled health care workers and laboratory facilities to ensure accurate diagnosis. No inferences can be drawn from the figures shown concerning the efforts or progress that countries are making in controlling particular diseases. Case numbers are also a poor indication of the burden of disease. Diseases such as H5N1 influenza and plague have high mortality rates, while diseases such as poliomyelitis and leprosy have low mortality rates but result in a heavy loss of healthy years of life. Some diseases with very small initial case numbers can potentially cause devastating epidemics, and so mandatory reporting is essential. For diseases that are considered eradicable (such as leprosy and poliomyelitis) case reporting is essential to ensure that eradication efforts are targeted to the affected areas.

Some diseases are reported under the International Health Regulations, while others are monitored by countries or by WHO in the context of specific control programmes. Further information on disease incidence and prevalence, as well as on immunization coverage rates for vaccine-preventable diseases, can be obtained from the relevant WHO programme.

4. Health service coverage

Health service coverage indicators reflect the extent to which people in need actually receive important health interventions. Such interventions include reproductive health services; the provision of skilled care to women during pregnancy and childbirth; immunization to prevent common childhood infections; vitamin A supplementation in children; and the prevention and treatment of disease in children, adolescents and adults. Table 4 presents data on the following related MDG indicators: unmet need for family planning; contraceptive prevalence; antenatal care coverage; births attended by skilled health personnel; measles immunization coverage among 1-year-olds; children aged <5 years sleeping under insecticide-treated nets; children aged < 5 years with fever who received treatment with any antimalarial; antiretroviral therapy coverage among people with advanced HIV infection; case-detection rate for all forms of tuberculosis; and treatment-success rate for smear-positive tuberculosis.

Data are also presented on births by caesarean section; postnatal care coverage; neonates protected at birth against neonatal tetanus; 1-year-olds immunized against diphtheria, tetanus and pertussis, hepatitis B and *Haemophilus influenzae* type B; children aged 6–59 months who received vitamin A supplementation; children aged < 5 years with acute respiratory infection (ARI) symptoms taken to a health facility; children aged < 5 years with ARI symptoms receiving antibiotics; children aged <5 years with diarrhoea receiving oral rehydration therapy (ORT); and coverage of antiretroviral therapy among pregnant women with HIV to prevent mother-to-child transmission (MTCT).

Coverage indicators are typically calculated by dividing the number of people receiving a defined intervention by the population eligible for – or in need of – the intervention. For example, immunization coverage among 1-year-old children can be calculated from the number of children having received a specific vaccine divided by the total population of 1-year-old children in each country. For indicators on antenatal care, births attended by skilled health personnel and births by caesarean section, the denominator is the total number of live births in the defined population.

The main sources of data on health service coverage are household surveys and completed questionnaires on health service use. The principal types of surveys used are the UNICEF Multiple Indicator Cluster Survey (MICS), the Demographic and Health Survey (DHS) and country health and economic surveys. Other sources of data include the administrative records of routine service provision, which provide data on the numerator. The denominator is estimated on the basis of census projections. It should be borne in mind that administrative records tend to overestimate coverage as a result of double counting in the numerator and uncertainty in the denominator. Although household surveys are generally considered to be more reliable, these are subject to respondent reporting errors as well as to margins of uncertainty due to sampling errors. In generating global estimates, it is good practice to reconcile data from multiple sources in order to maximize the accuracy of all estimates.

Unavoidable terminology differences also exist between countries making standardization difficult.

For example, there are significant variations across countries in the precise skills and training of health workers classified as “skilled birth attendants”. Indicator definitions may also change over time. As a result of these and other issues, there may be limitations in the comparability of results across countries and over time. WHO regional aggregates are not available for several coverage indicators, reflecting both the limited availability of data for several indicators, and the fact that some conditions (such as malaria) are not of public health significance in all countries.

^a *World Contraceptive Use 2012*. United Nations, Department of Economic and Social Affairs, Population Division, 2012. WHO regional, income-group and global aggregates refer to 2010. The methodology for the aggregates is available in *World Contraceptive Use 2012* and in the technical paper: Alkema, et al. National, regional and global levels and trends in contraceptive prevalence and unmet need for family planning between 1990 and 2015: a systematic and comprehensive analysis (forthcoming).

^b WHO global database on maternal health indicators, 2013 update. Geneva, World Health Organization (<http://www.who.int/gho>). Antenatal care coverage only includes visits to a skilled provider (doctor, nurse and/or midwife). Births attended by skilled health personnel refer to doctor, nurse and/or midwife. Postnatal care was surveyed only for the mother.

^c Proportion of neonates protected at birth against neonatal tetanus through maternal immunization with tetanus toxoid, based on a mathematical model taking into account the mother's immunization in infancy, during pregnancy and in tetanus campaigns. WHO/UNICEF estimates of national immunization coverage. Geneva, World Health Organization, 2012 (http://www.who.int/immunization_monitoring/routine/immunization_coverage/en/index4.html). Estimates based on data available up to July 2012. This indicator applies only to countries where tetanus is recommended for girls and women and therefore WHO regional, income-group and global aggregates relate only to these same Member States.

^d Measles = measles-containing vaccine (MCV); DTP3 = 3 doses of diphtheria-tetanus pertussis vaccine; HepB3 = 3 doses of hepatitis B vaccine; Hib3 = 3 doses of *Haemophilus influenzae* type B vaccine. WHO/UNICEF estimates of national immunization coverage. Geneva, World Health Organization, 2012 (http://www.who.int/immunization_monitoring/routine/immunization_coverage/en/index4.html). Estimates based on data available up to July 2012. For countries recommending the first dose of

measles vaccine in children older than 12 months of age, the indicator is calculated as the proportion of children less than 24 months of age receiving one dose of measles-containing vaccine. Complete coverage estimates available online at the above web site.

^e Data compiled by WHO from Demographic and Health Surveys (DHS) and Multiple Indicator Cluster Surveys (MICS), January 2013 (<http://www.measuredhs.com> and http://www.unicef.org/statistics/index_24302.html). Vitamin A supplementation data refer to the six months preceding the survey; data on children receiving oral rehydration salts (ORS) and/or recommended home fluids (RHF) refer to the two weeks preceding the survey; and data on children who were ill with a cough accompanied by rapid breathing (ARI symptoms) and who were taken to a health facility and/or received antibiotics refer to the two weeks preceding the survey.

^f *World Malaria Report 2012*. Geneva, World Health Organization, 2012 (http://www.who.int/malaria/publications/world_malaria_report_2012/en/index.html).

^g *State of the World's Children 2013: Children with Disabilities*. New York, UNICEF (forthcoming).

^h *UNAIDS Report on the Global AIDS Epidemic 2012*. Geneva, UNAIDS, 2012 (http://www.unaids.org/en/resources/campaigns/20121120_globalreport2012/globalreport). WHO regional aggregates include low- and middle-income countries only. For uncertainty ranges see the report.

ⁱ The case-detection rate for all forms of tuberculosis is the estimated number of new and relapse tuberculosis cases diagnosed and treated in national tuberculosis control programmes and notified to WHO, divided by WHO's estimate of the number of incident tuberculosis cases for the same year, expressed as a percentage. *Global Tuberculosis Report 2012*. Geneva, World Health Organization, 2012 (http://www.who.int/tb/publications/global_report/). For uncertainty ranges see the full report. WHO regional, income-group and global aggregates include territories.

^j The treatment-success rate for new pulmonary smear-positive tuberculosis cases is the proportion of new smear-positive tuberculosis cases registered under a national tuberculosis control programme in a given year that successfully completed treatment – with or without bacteriological evidence of success (“cured” and “treatment completed” respectively). *Global Tuberculosis Report 2012*. Geneva, World Health Organization, 2012 (http://www.who.int/tb/publications/global_report/). WHO regional, income-group and global aggregates include territories.

^k Definition of skilled personnel differs from standard definition.

^l Skilled personnel not defined.

^m Data only includes information from Queensland, South Australia, Australian Capital Territory and the Northern Territory.

ⁿ Five or more visits.

^o Institutional births.

^p Data refer to children aged 9–59 months.

^q Separate surveys for Wallonie, Brussels and the Flemish region all report figures for institutional births above 99%.

^r Refers to ARI and/or fever.

^s Data from the public system only.

^t Only women who gave birth outside of a health facility.

^u Caesarean section covered by the Costa Rican Social Security Fund – Caja Costarricense del Seguro Social (CCSS).

^v ORT and/or RHF and/or increased fluids.

^w Visits to gynaecologist.

^x No timing of postnatal visit was provided.

^y Three or more visits.

^z Mean number of visits reported is more than seven.

^{aa} Data from public hospitals only.

^{ab} Data from government and private hospitals only.

^{ac} Postnatal care visit was 1–15 days postpartum.

^{ad} Continued feeding.

^{ae} Six or more visits.

^{af} Postnatal care visit was 0–7 days postpartum.

^{ag} Deliveries in Ministry of Health institutions only.

^{ah} Postnatal care visit was 0–15 days postpartum.

^{ai} ORS or any other fluid.

^{aj} Separate datasets for England, Wales, Scotland and Northern Ireland report figures of 24.8, 26.0, 26.6 and 29.9 respectively.

5. Risk factors

Table 5 presents information on indicators for certain risk factors that are associated with increased mortality and morbidity. These preventable risk factors include: unsafe water and lack of sanitation; use of solid fuels in households; low birth weight; poor infant-feeding practices; childhood under-nutrition and overnutrition; diabetes; hypertension; obesity; harmful consumption of alcohol; use of tobacco; and unsafe sex.

Unsafe water supplies and inadequate levels of sanitation and hygiene increase the transmission of diarrhoeal diseases (including cholera); trachoma; and hepatitis. The use of solid fuels in households is a proxy indicator for household air pollution. Using solid fuels such as wood, charcoal and crops is associated with increased mortality from pneumonia and other acute lower respiratory diseases among children, as well as increased mortality from chronic obstructive pulmonary disease, lung cancer (where coal is used) and other diseases among adults.

One in ten babies are born preterm (born alive before 37 weeks of pregnancy) and one million die from the complications of such births each year. More than three quarters of premature babies can be saved with feasible and cost-effective care.

Child growth is the most widely used measure of children's nutritional status. Included in the estimates presented in Table 5 are the four indicators: "wasted"; "stunted"; "underweight" (which is an MDG indicator); and "overweight". Stunting (i.e. low height-for-age) reflects the cumulative effects of under-nutrition and infections since birth – and even before birth. Evidence of this condition indicates chronic malnutrition, which is likely to have serious and long-lasting impacts on health. Being underweight may reflect wasting (i.e. low weight-for-height) which indicates acute weight loss and/or stunting. Thus, it is a composite indicator that is more difficult to interpret. Fewer data are available on the number of overweight children, although it is known that many countries face a double burden of malnutrition (with high numbers of underweight or stunted children) in some population groups coupled with high numbers of overweight children in other groups.

In adults, diabetes, hypertension and being overweight or obese increase the risk of cardiovascular disease and several types of cancer. These risks also contribute to non-fatal diseases such as arthritis and loss of vision due to diabetic retinopathy. Once considered a problem only in high-income countries, obesity is on the rise in low- and middle-income countries, particularly in the WHO African Region and the WHO Region of the Americas. The prevalence of hypertension is highest in some low-income countries in Africa, whereas public health interventions have reduced its prevalence in many high-income countries.

The prevalence of current tobacco smoking is an important predictor of the future burden of tobacco-related diseases. Harmful use of alcohol can cause alcohol dependence, hepatic cirrhosis, cancer and injuries.

Data on risk factors and health-related behaviours are generally drawn from household surveys. It is important to note that the reliability of these estimates depends upon the overall quality of the sampling frames and methods used; on interviewer training, data-quality assurance procedures, and statistical data analyses; and on the ability and willingness of respondents to provide accurate responses. Where data from household surveys are not available, statistical techniques may be used to develop estimates.

^a. *Progress on Drinking Water and Sanitation: 2013 Update*. New York, UNICEF and Geneva, World Health Organization, 2012 (forthcoming).

^b. These estimates are based on the WHO Household Energy database (available at: <http://apps.who.int/ghodata/>). This database contains compiled information on cooking-fuel use and cooking practices from about 580 nationally representative data sources, including all Demographic and Health Surveys (Macro International), Multiple Indicator Cluster Surveys (UNICEF), World Health Surveys (WHO) and Living Standards Measurement Studies (World Bank) as well as national censuses/surveys and national energy statistics. Unless otherwise noted, where solid fuel use information is available for a country it was derived using a multi-level model approach which only accounts for regions, countries and time as a spline function, and estimates are restricted to values ranging from zero to one. Income-group aggregates are based on the 2011 World Bank list of economies.

^c. Blencowe H et al. National, regional, and worldwide estimates of preterm birth rates in the year 2010 with time trends since 1990 for selected countries: a systematic analysis and implications. *Lancet*. 2012 9 June, 379(9832):2162–2172. See the paper for income groupings used.

^d. WHO global data bank on infant and young child feeding. Geneva, World Health Organization, 2012 (<http://www.who.int/nutrition/databases/infantfeeding>).

^e. Global database on child growth and malnutrition. Geneva, World Health Organization, 2012 (<http://www.who.int/nutgrowthdb/database/en>). For the reference period 1990–1995, figures refer to the first available survey year in the period. For the reference period 2005–2011, figures refer to the latest available survey year in the period. Wasted is calculated as the prevalence of low weight-for-height less than -2 standard deviations; underweight is the prevalence of weight-

for-age less than -2 standard deviations; stunting is the prevalence of height-for-age less than -2 standard deviations; and overweight is the prevalence of weight-for-height above +2 standard deviations (using the WHO Child Growth Standards median). Global estimates refer to 2011 for wasted, stunting and overweight, and 1990 and 2011 for underweight. For more information, see the above database.

^f. Percentage of population aged 25 years and over with fasting glucose ≥ 126 mg/dl (7.0 mmol/l) or on medication for raised blood glucose. *Global status report on noncommunicable diseases 2010*. Geneva, World Health Organization, 2011 (http://www.who.int/nmh/publications/ncd_report2010). See Annex 4: Country estimates of NCD mortality and selected risk factors, 2008. Figures reported are age-standardized point estimates, and uncertainty ranges are available at the Global Health Observatory web site (<http://www.who.int/gho>). Income-group aggregates are based on the 2008 World Bank list of economies.

^g. Percentage of population aged 25 years and over with raised blood pressure (systolic blood pressure ≥ 140 or diastolic blood pressure ≥ 90). Global Health Observatory. Geneva, World Health Organization, 2011. Figures reported are age-standardized point estimates, and uncertainty ranges are available at the Global Health Observatory web site (<http://www.who.int/gho>). Income-group aggregates are based on the 2008 World Bank list of economies.

^h. Percentage of population aged 20 years and over with a body mass index ≥ 30.00 kg/m². *Global status report on noncommunicable diseases 2010*. Geneva, World Health Organization, 2011 (http://www.who.int/nmh/publications/ncd_report2010). See Annex 4: Country estimates of NCD mortality and selected risk factors, 2008. Figures reported are age-standardized point estimates, and uncertainty ranges are available at the Global Health Observatory web site (<http://www.who.int/gho>). Income-group aggregates are based on the 2008 World Bank list of economies.

^f Global information system on alcohol and health. Geneva, World Health Organization, 2011 (<http://apps.who.int/gho/data/view.main?showonly=GISAH>). The figures for 2008 have been produced by the projection of 2005 estimates. Definition of indicator: total (sum of recorded and unrecorded) amount of alcohol consumed per adult (15+ years) over a calendar year, in litres of pure alcohol. Recorded alcohol consumption refers to official statistics (production, import, export, and sales or taxation data), while the unrecorded alcohol consumption refers to alcohol which is not taxed and is outside the usual system of governmental control. When the number of yearly tourists is greater than or equal to the number of inhabitants, the tourist consumption is deducted from the country's recorded consumption.

^g WHO report on the global tobacco epidemic, 2011: warning about the dangers of tobacco. Geneva, World Health Organization, 2011 (http://www.who.int/tobacco/global_report/2011/en/). See Appendix VII: Age-standardized prevalence estimates for smoking, 2009. Definition of indicator: smoking at the time of the survey of any form of tobacco, including cigarettes, cigars, pipes, bidis, etc. and excluding smokeless tobacco. These figures represent age-standardized prevalence rates for smoking tobacco and should only be used to draw comparisons of prevalence between countries, and between men and women within a country. They should not be used to calculate the number of smokers in a country, region or globally. Income-group aggregates are based on the 2011 World Bank list of economies.

^h WHO report on the global tobacco epidemic, 2011: warning about the dangers of tobacco. Geneva, World Health Organization, 2011 (http://www.who.int/tobacco/global_report/2011/en/). Data relate to tobacco use in any form in the 30 days prior to the most recent Global Youth Tobacco Survey (<http://www.who.int/tobacco/surveillance/gyts/en/>). Data from other youth surveys are excluded for comparability reasons. Income-group aggregates are based on the 2011 World Bank list of economies.

ⁱ Percentage of women and men aged 15–49 years who had more than one sexual partner in the past 12 months reporting the use of a condom during their last sexual intercourse. Data compiled from Demographic and Health Surveys, January 2013 (<http://www.measuredhs.com>).

^m Percentage of women and men aged 15–24 years who both correctly identify ways of preventing the sexual transmission of HIV and reject major misconceptions about HIV transmission. Data compiled from Demographic and Health Surveys, January 2013 (<http://www.measuredhs.com>).

ⁿ No country data available. Estimate modelled using data from other countries and specific country characteristics.

^o Subnational data.

^p For high-income countries with a Gross National Income (GNI) of more than US\$ 12 276 per capita in any given year, as classified by the World Bank (<http://data.worldbank.org/about/country-classifications>, accessed 12 January 2012) solid fuel use is assumed to be less than 5%. Rehfuess EA, Mehta S, Pruss-Ustun A. Assessing Household Solid Fuel Use – Multiple Implications for the Millennium Development Goals. *Environmental Health Perspectives*, 2006, 114(3):373–378.

^q No solid fuel use information was available for the country, and population-weighted regional means were used. Estimates in countries without survey data should be interpreted with caution, and provide indicative values only.

^r Data refer to children at 6 months. *Breastfeeding Report Card 2012, United States: Outcome Indicators*. Atlanta, United States CDC (<http://www.cdc.gov/breastfeeding/data/reportcard2.htm>).

6. Health systems

Table 6 presents data on the resources available to health systems, such as workforce (physicians, nurses and midwives, other health-care workers); infrastructure (hospitals, and hospital and psychiatric beds); medical technologies and devices (radiotherapy and computed tomography units); and access to essential medicines.²⁹ Such data are essential in enabling governments to determine how best to meet the health-related needs of their populations. For example, mental health services depend primarily on trained human resources such as mental health specialists (for example, psychiatrists), psychosocial workers (for example, psychologists) and non-specialist health workers such as primary care staff. The density of psychiatrists is the most widely available and reliable indicator of the human resources available to mental health services, and provides a crude proxy of mental health system capacity.

Estimates of health personnel densities refer to the active health workforce – i.e. those currently participating in the health labour market. Data are derived from multiple sources, including national population censuses, labour-force and employment surveys, health-facility assessments and routine administrative information systems.³⁰ Due to the wide diversity of available information sources, there is considerable variability in the coverage and quality of data. Figures may be under-estimated or over-estimated where it is not possible to determine whether or not they include health workers in the private sector, or to identify the double counting of health workers holding two or more jobs at different locations. In addition, health service providers may be working outside the health-care sector, working in unpaid and/or unregulated conditions, or not currently engaged in the national health labour market.

The density of hospital beds can be used to indicate the availability of inpatient services. Statistics on hospital-bed density are generally drawn from routine administrative records but in some settings only public-sector beds are included. The density of psychiatric beds provides an estimate of national capacity to treat serious mental disorders that require brief or extended inpatient care. The density of psychiatric beds in any country should be interpreted alongside other resources for mental health care, since beds very often account for a high proportion of all the resources allocated to mental health care.

Medical devices are indispensable in the prevention, diagnosis or treatment of a disease and in rehabilitation and palliative care. As essential basic equipment is still not available everywhere, a United Nations Commission on Life Saving Commodities will be addressing the availability of basic neonatal resuscitation units along with 13 other commodities. At present, the density of computed tomography scanners and radiotherapy equipment acts as an indicator of the availability of expensive high-end equipment for diagnostic imaging and cancer radiotherapy.

²⁹ MDG 8; Target 8.E: In cooperation with pharmaceutical companies, provide access to affordable essential drugs in developing countries.

³⁰ These include registries on public expenditure, staffing and payroll, as well as records of professional training, registration and licensure.

Data on the availability of medicines are poor in most developing countries. However, data on the availability and consumer prices for selected generic medicines have been derived from surveys conducted using WHO/Health Action International (HAI) standard methods between 2001 and 2012. In individual surveys, availability is reported as the percentage of medicine outlets in which a medicine was found on the day of data collection. As baskets of medicines differ by country, results are not strictly comparable across countries. The consumer price ratio is an expression of how much more – or less – the local medicine price is than the international reference price.

^a Source: WHO Global Health Workforce Statistics [<http://who.int/hrh/statistics/hwstats/en/index.html>]. Please see this source for the latest updates, disaggregated health workforce statistics and metadata descriptors. In general, the denominator data for health workforce density (i.e. national population estimates) were obtained from the United Nations Population Division's World population prospects database. In some cases the official report provided only workforce density indicators, from which estimates of the stock were calculated. For dentists, pharmacists and environment and public health professionals, the associate professional level occupations may not always be distinguishable from professional level occupations due to variability of data sources. Community health workers include community health officers, community health-education workers, community health aides, family health workers, lady health visitors, health extension package workers and related occupations, whenever available. Due to variability of data sources and national occupation titles, the figures provided may not always be comparable or comprehensive.

^b Figures include nursing personnel and midwifery personnel, whenever available. In many countries nurses trained with midwifery skills are counted and reported as nurses. This makes the distinction between nursing personnel and midwifery personnel difficult to achieve.

^c *Mental health atlas 2011*. Geneva, World Health Organization, 2011 (http://www.who.int/mental_health/publications/mental_health_atlas_2011/). Income-group aggregates are based on the 2011 World Bank list of economies.

^d Data are derived from the WHO Baseline country survey on medical devices 2010 conducted between early 2010 and late 2011. Geneva, World Health Organization,

2011 (http://whqlibdoc.who.int/hq/2011/WHO_HSS_EHT_DIM_11.01_eng.pdf). Densities were computed by adding both public-sector and private-sector data unless otherwise noted. Hospitals include district, rural, provincial, specialized, teaching and research hospitals. Radiotherapy units include Linear Accelerators and Cobalt-60 units. Income-group aggregates are based on the 2011 World Bank list of economies.

^e PAHO/WHO Country Representative and National Authorities. Data provided by Member States on basic indicators via an online data-entry tool. Washington DC, 2012. As of June 2012; European health for all database (HFA-DB). Copenhagen, WHO Regional Office for Europe, 2011 (<http://data.euro.who.int/hfad/>); Western Pacific Country Health Information Profiles 2012–2013 Revision (forthcoming). Manila, WHO Regional Office for the Western Pacific, 2010 (<http://www.wpro.who.int/hdb/Default.aspx>); Regional Health Observatory. Cairo, WHO Regional Office for the Eastern Mediterranean, 2011 (<http://rho.emro.who.int/rhodata/>); additional data compiled as of January 2011 by the WHO Regional Office for Africa and the WHO Regional Office for South-East Asia. Depending on the source and means of monitoring, data may not be exactly comparable across countries. See above sources for country-specific details.

^f Surveys of medicine prices and availability using WHO/HAI standard methodology conducted between 2001 and 2012 (available at: <http://www.haiweb.org/medicineprices/>). In individual surveys, availability is reported as the percentage of medicine outlets in which a medicine was found on the day of data collection. As baskets of medicines differ by individual country, results are not exactly comparable across countries. Median availability is determined for the specific list of medicines in

Infrastructures and technologies					Essential medicines

each survey, and does not account for alternate dosage forms or strengths of these products or for therapeutic alternatives. Public-sector data may be limited by the fact that the list of survey medicines may not correspond to national essential medicines lists (EMLs) where these exist, and some public-sector facilities may not be expected to stock all of the survey medicines. This has been addressed in the revised edition of the survey tool, which allows public-sector data to be analysed by EML status and level of care.

^g Surveys of medicine prices and availability using WHO/HAI standard methodology conducted between 2001 and 2012 (available at: <http://www.haiweb.org/medicineprices/>). Consumer price ratio = ratio of median local unit price to the Management Sciences for Health (MSH) international reference price of selected generic medicines. Data are unadjusted for differences in the MSH reference price year used, exchange-rate fluctuations, national inflation rates, variations in purchasing power parities, levels of development or other factors. In each survey, median consumer price ratios are obtained for the basket of medicines surveyed and found in at least four medicine outlets. As baskets of medicines differ by individual country, results are not exactly comparable across countries. However, data on specific medicines are publicly available at the above HAI web site, and matched basket comparisons on a subset of medicines can be made.

^h Absolute numbers obtained from Gal D, Bates I, Eds. 2012 *FIP Global Pharmacy Workforce Report*. The Hague, International Pharmaceutical Federation, 2012, p. 85. Available online at: <http://www.fip.org/static/fipeducation/2012/FIP-Workforce-Report-2012/?page=hr2012>.

ⁱ Refers to the public sector only.

^j Data derived from the Directory of Radiotherapy Centres (DIRAC) from the International Atomic Energy Agency (IAEA).

^k Based on a survey of medicine prices and availability in Rio Grande do Sul State, Brazil.

^l Medicines are provided free to patients in the public sector.

^m Refers to the private sector only.

ⁿ Simple average of three surveys of medicine prices and availability in China (Shaanxi, Shandong and Shanghai provinces).

^o Simple average across seven state surveys.

^p No public-sector medicine outlets available.

^q Based on a survey in Mexico City, Mexico.

^r Based on a survey in Tatarstan province, Russian Federation.

^s Based on a survey of medicine prices and availability in Gauteng province, South Africa.

^t Simple average of four surveys in Sudan (Gadarif, Khartoum, North Kordofan and Northern states).

7. Health expenditure

Table 7 presents data on government expenditure on health and on private expenditure on health, including externally funded expenditure on health. Sub-components of government expenditure on health (“social security expenditure”) and private expenditure on health (“out-of-pocket expenditure”; and “private prepaid plans”) are also included. These data are generated from information that has been collected by WHO since 1999. The most comprehensive and consistent data on health financing are generated from national health accounts (NHAs) that collect expenditure information within an internationally recognized framework. NHAs trace financing as it flows from funding sources to decision-makers (who decide upon the use of the funds) and then to the providers and beneficiaries of health services. Not all countries maintain or update NHAs – in such cases, data are obtained through technical contacts in the country or from publicly available documents and reports. Missing values are estimated using various accounting techniques depending upon the data available for each country.³¹ WHO sends all such estimates to the respective ministries of health every year for validation.

³¹ To obtain the latest updates, a full series or more-disaggregated health expenditures including metadata and sources, see: <http://www.who.int/nha/>.

^a. Source: Health expenditure series, Geneva, World Health Organization (latest updates available at: <http://apps.who.int/nha/database/DataExplorerRegime.aspx>). All indicators refer to expenditures by financing agent except "external resources for health" which is a financing source. WHO regional, income-group and global aggregates are calculated using Purchasing Power Parity (PPP) terms unless otherwise noted. For health expenditure ratios, values smaller than 0.05% may appear as zero. For per capita indicators, when the value is less than 0.5 it is represented as < 1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2010 data will cover the fiscal year 2009–2010), unless otherwise stated for the country.

^b. Absolute values of expenditures are expressed in nominal terms (current prices).

^c. In some cases, the sum of general government and private expenditures on health may not add up to 100% because of rounding.

^d. Care needs to be taken in interpreting external resource figures. Most are taken from the OECD DAC/CRS database except where a reliable full NHA study has been conducted or official data were found.

^e. National currency unit per US\$ are calculated using the average exchange rates for the year. WHO regional, income-group and global aggregates are calculated using constant US\$.

^f. PPP series resulting from the 2005 International comparison project (ICP) estimated by the World Bank has been used. In countries where this is not available, PPPs are estimated by WHO.

^g. A new basis for these estimates was provided by new NHA reports, surveys, National Accounts series, accessed information and/or country consultations.

^h. About 30% of the expenditure in residential facilities for care of the aged has a health purpose, but this is difficult to estimate routinely and so is not included under health at present. Such health-purpose expenditure was about US\$ 2.1 billion in 2005–2006 or 0.2% of GDP.

ⁱ. Adjustments for currency change (from old to new manat) were made for the entire Azerbaijan series starting from World Health Statistics 2008.

^j. Fiscal year starts in July and expenditure data have been allocated to the later calendar year (i.e. 2007 data covers the fiscal year 2006–2007).

^k. Fiscal year starts in April and expenditure data have been allocated to the earlier calendar year (i.e. 2006 data cover the fiscal year 2006–2007).

^l. Estimates should be viewed with caution as these are derived from scarce data.

^m. Increases in government expenditure on health are due to investment in capital expenditures.

ⁿ. The change in the trend of Out-of-pocket expenditure in 2008 is driven by a large decrease in total private consumption in 2008 and a big increase in 2009.

^o. As a result of recent health-care reforms in Georgia, public compulsory insurance has, since 2008, been implemented by private insurance companies. The voucher cost of this insurance is treated as general government health expenditure.

^p. Government expenditures show fluctuations due to variations in capital investment.

Health expenditure ratios ^a				Per capita health expenditures ^{a,b}								
Out-of-pocket expenditure as % of private expenditure on health		Private prepaid plans as % of private expenditure on health		Per capita total expenditure on health at average exchange rate ^c (US\$)		Per capita total expenditure on health ^f (PPP int. \$)		Per capita government expenditure on health at average exchange rate ^e (US\$)		Per capita government expenditure on health ^f (PPP int. \$)

^a Exchange rate changed in 2002 from multiple to a managed floating exchange rate. Inter-bank market rate used prior to 2002.

^c The estimates do not include expenditures for Northern Iraq.

^d The public expenditure on health includes contributions from the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA) made to Palestinian refugees residing in Jordanian territories.

^e Fiscal year starts in October and expenditure data have been allocated to the later calendar year (i.e. 2007 data cover the fiscal year 2006–2007).

^f The market exchange rate is used to estimate the per capita figures.

^g Total level of government expenditure on health increased due to the inclusion of local government expenditure, as well as a more-comprehensive estimation of regional expenditure on health.

^h The health expenditure data as well as the population data after 2000 do not include Transnistria. Data on GDP and private final consumption expenditure exclude Transnistria from 1995.

ⁱ The estimates do not include the expenditures of the provinces of Kosovo and Metohia, which are under the administration of the United Nations.

^j Out-of-pocket expenditure figures from the NHA report have been estimated from the Sierra Leone Integrated Household Survey (SLIHS) 2004. Because the SLIHS 2010 had been conducted but not yet analysed, the 2004 figures had to be increased according to inflation to provide a best estimate.

^z The exchange rate used for the Syrian Arab Republic is the rate for non-commercial transactions from the Central Bank of Syria.

^{ab} GDP does not include the income from petroleum. Drop in health expenditures from previous year is mainly due to revision of Out-of-pocket expenditure estimates.

^{ab} On 1 January 2009 Turkmenistan introduced the new manat ISO code TMT. The exchange rate between the old and the new currency is 1 TMT = 5000 TMM. The entire health expenditure series has been adjusted.

8. Health inequities

In general, the global reporting of health indicators focuses on national averages. However, data on the distribution of health and health services within countries and between population subgroups are equally important. Such data help to identify health inequities – unfair and avoidable differences in health and health service provision – that arise for example from socioeconomic factors (such as level of education, occupation, and household wealth or income), from geographical location, and/or from ethnicity and gender.

Table 8 covers data from 82 countries collected during Demographic and Health Surveys (DHS) and Multiple Indicator Cluster Surveys (MICS) conducted between 2005 and 2011. Six health indicators are presented – modern contraceptive prevalence; antenatal care coverage; births attended by skilled health personnel; DTP3 immunization coverage among 1-year-olds; children < 5 years of age who are stunted; and under-five mortality rate – with data disaggregated according to urban or rural residence, household wealth, maternal educational level, and where appropriate by the sex of the child.

For household wealth and maternal educational level, point estimates are shown for subgroups with the highest and lowest levels of these measures. A complete set of disaggregated data on these and other health indicators is available at the Health Equity Monitor of the WHO Global Health Observatory.³²

³² Health Equity Monitor, Global Health Observatory. See: http://www.who.int/entity/gho/health_equity/en/index.html

^a. Data are derived from the re-analysis of publicly available Demographic and Health Surveys (DHS) and Multiple Indicator Cluster Surveys (MICS) micro-data, using the standard indicator definitions as published in DHS or UNICEF documentation. The analysis was carried out by the International Center for Analysis and Monitoring of Equity in Health and Nutrition based in the Federal University of Pelotas, Brazil, and updated in December 2012. In some cases there may be slight differences between these results and those reported in DHS or MICS country reports due to differences in the calculation of indicator numerators and/or denominators.

^b. Data derived from DHS relate to the most recent live births occurring in the five years preceding the survey.

^c. Data derived from DHS relate to births occurring in the five years preceding the survey. Data derived from MICS relate to births occurring in the two years preceding the survey.

^d. The under-five mortality rate relates to the decade preceding the survey.

^e. The figure is not reported as it is based on fewer than 25 cases.

^f. The figure is not reported as it is based on fewer than 250 unweighted person-years of exposure to the risk of death.

^g. The figure is based on a small number of cases (25–49 unweighted cases).

^h. The figure is based on 250–499 unweighted person-years of exposure to the risk of death.

9. Demographic and socioeconomic statistics

Table 9 presents data on demographic and socioeconomic factors that are major determinants of health. The table includes four MDG-related indicators – adolescent fertility; primary school enrolment; population living in poverty; and cellular phone subscriber rates. The table also includes data on demographics (such as population size, growth and degree of urbanization); crude birth and death rates; coverage of civil registration of births and underlying cause of death; adult literacy; and per capita gross national income. In addition to their intrinsic value, such data are also important in making other statistics comparable across countries. For example, data on disease incidence, prevalence and mortality rates – and on the availability of health-system resources – all require reliable population-based denominators.

These demographic and socioeconomic statistics have been derived from data produced by a range of national and international organizations. The latter include the United Nations International Telecommunication Union (ITU), the United Nations Department of Economic and Social Affairs (UN-DESA), the United Nations Educational, Scientific and Cultural Organization (UNESCO), the United Nations Children's Fund (UNICEF) and the World Bank. Estimates are based on a combination of administrative records, population-based surveys, censuses and civil-registration data, and on statistical modelling to adjust for missing values. For more information on the sources and methods used for a particular indicator, please refer to the relevant footnotes below and to the web site of the relevant organization.

Annex 1.

Regional and income groupings

WHO regional groupings¹

WHO African Region: Algeria, Angola, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Cape Verde, Central African Republic, Chad, Comoros, Congo, Côte d'Ivoire, Democratic Republic of the Congo, Equatorial Guinea, Eritrea*, Ethiopia, Gabon, Gambia, Ghana, Guinea, Guinea-Bissau, Kenya, Lesotho, Liberia, Madagascar, Malawi, Mali, Mauritania, Mauritius, Mozambique, Namibia, Niger, Nigeria, Rwanda, Sao Tome and Principe, Senegal, Seychelles, Sierra Leone, South Africa, Swaziland, Togo, Uganda, United Republic of Tanzania, Zambia, Zimbabwe.

WHO Region of the Americas: Antigua and Barbuda, Argentina, Bahamas, Barbados, Belize, Bolivia (Plurinational State of), Brazil, Canada, Chile, Colombia, Costa Rica, Cuba, Dominica, Dominican Republic, Ecuador, El Salvador, Grenada, Guatemala, Guyana, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama, Paraguay, Peru, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, Trinidad and Tobago, United States of America, Uruguay, Venezuela (Bolivarian Republic of).

WHO South-East Asia Region: Bangladesh, Bhutan, Democratic People's Republic of Korea, India, Indonesia, Maldives, Myanmar, Nepal, Sri Lanka, Thailand, Timor-Leste*.

WHO European Region: Albania, Andorra*, Armenia*, Austria, Azerbaijan*, Belarus, Belgium, Bosnia and Herzegovina*, Bulgaria, Croatia*, Cyprus, Czech Republic*, Denmark, Estonia*, Finland, France, Georgia*, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Kazakhstan*, Kyrgyzstan*, Latvia*, Lithuania*, Luxembourg, Malta, Monaco, Montenegro*, Netherlands, Norway, Poland, Portugal, Republic of Moldova*, Romania, Russian Federation, San Marino, Serbia*, Slovakia*, Slovenia*, Spain, Sweden, Switzerland, Tajikistan*, The former Yugoslav Republic of Macedonia*, Turkey, Turkmenistan*, Ukraine, United Kingdom, Uzbekistan*.

WHO Eastern Mediterranean Region: Afghanistan, Bahrain, Djibouti, Egypt, Iran (Islamic Republic of), Iraq, Jordan, Kuwait, Lebanon, Libya, Morocco, Oman, Pakistan, Qatar, Saudi Arabia, Somalia, South Sudan, Sudan, Syrian Arab Republic, Tunisia, United Arab Emirates, Yemen.

WHO Western Pacific Region: Australia, Brunei Darussalam, Cambodia, China, Cook Islands, Fiji, Japan, Kiribati, Lao People's Democratic Republic, Malaysia, Marshall Islands*, Micronesia (Federated States of)*, Mongolia, Nauru*, New Zealand, Niue*, Palau*, Papua New Guinea, Philippines, Republic of Korea, Samoa, Singapore, Solomon Islands, Tonga, Tuvalu*, Vanuatu, Viet Nam.

¹. Member States indicated with an * may have data for periods prior to their official membership of WHO.

Income groupings^{2,3}

Low income: Afghanistan, Bangladesh, Benin, Burkina Faso, Burundi, Cambodia, Central African Republic, Chad, Comoros, Democratic People's Republic of Korea, Democratic Republic of the Congo, Eritrea, Ethiopia, Gambia, Guinea, Guinea-Bissau, Haiti, Kenya, Kyrgyzstan, Liberia, Madagascar, Malawi, Mali, Mauritania, Mozambique, Myanmar, Nepal, Niger, Rwanda, Sierra Leone, Somalia, Tajikistan, Togo, Uganda, United Republic of Tanzania, Zimbabwe.

Lower middle income: Albania, Armenia, Belize, Bhutan, Bolivia (Plurinational State of), Cameroon, Cape Verde, Congo, Côte d'Ivoire, Djibouti, Egypt, El Salvador, Fiji, Georgia, Ghana, Guatemala, Guyana, Honduras, India, Indonesia, Iraq, Kiribati, Lao People's Democratic Republic, Lesotho, Marshall Islands, Micronesia (Federated States of), Mongolia, Morocco, Nicaragua, Nigeria, Pakistan, Papua New Guinea, Paraguay, Philippines, Republic of Moldova, Samoa, Sao Tome and Principe, Senegal, Solomon Islands, South Sudan, Sri Lanka, Sudan, Swaziland, Syrian Arab Republic, Timor-Leste, Tonga, Ukraine, Uzbekistan, Vanuatu, Viet Nam, Yemen, Zambia.

Upper middle income: Algeria, Angola, Antigua and Barbuda, Argentina, Azerbaijan, Belarus, Bosnia and Herzegovina, Botswana, Brazil, Bulgaria, Chile, China, Colombia, Cook Islands**, Costa Rica, Cuba, Dominica, Dominican Republic, Ecuador, Gabon, Grenada, Iran (Islamic Republic of), Jamaica, Jordan, Kazakhstan, Latvia, Lebanon, Libya, Lithuania, Malaysia, Maldives, Mauritius, Mexico, Montenegro, Namibia, Nauru**, Niue**, Palau, Panama, Peru, Romania, Russian Federation, Saint Lucia, Saint Vincent and the Grenadines, Serbia, Seychelles, South Africa, Suriname, Thailand, The former Yugoslav Republic of Macedonia, Tunisia, Turkey, Turkmenistan, Tuvalu, Uruguay, Venezuela (Bolivarian Republic of).

High income: Andorra, Australia, Austria, Bahamas, Bahrain, Barbados, Belgium, Brunei Darussalam, Canada, Croatia, Cyprus, Czech Republic, Denmark, Equatorial Guinea, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Japan, Kuwait, Luxembourg, Malta, Monaco, Netherlands, New Zealand, Norway, Oman, Poland, Portugal, Qatar, Republic of Korea, Saint Kitts and Nevis, San Marino, Saudi Arabia, Singapore, Slovakia, Slovenia, Spain, Sweden, Switzerland, Trinidad and Tobago, United Arab Emirates, United Kingdom, United States of America.

² *World Bank list of economies* (July 2012). Washington, DC, World Bank, 2012 (<http://siteresources.worldbank.org/DATASTATISTICS/Resources/CLASS.XLS>).

³ Member States marked with an ** have been classified into income groups using gross domestic product.

The **World Health Statistics** series is WHO's annual compilation of health-related data for its 194 Member States, and includes a summary of the progress made towards achieving the health-related Millennium Development Goals (MDGs) and associated targets. This year, it also includes highlight summaries on the topics of reducing the gaps between the world's most-advantaged and least-advantaged countries, and on current trends in official development assistance (ODA) for health.

The series is produced by the WHO Department of Health Statistics and Information Systems of the Health Systems and Innovation Cluster. As in previous years, *World Health Statistics 2013* has been compiled using publications and databases produced and maintained by WHO technical programmes and regional offices. A number of demographic and socioeconomic statistics have also been derived from databases maintained by a range of other organizations.

All the indicators shown have been included on the basis of their relevance to global public health, the availability and quality of the data, and the reliability and comparability of the resulting estimates. Taken together, these indicators provide a comprehensive summary of the current status of national health and health systems in key areas.

WHO presents *World Health Statistics 2013* as an integral part of its ongoing efforts to provide enhanced access to comparable high-quality statistics on core measures of population health and national health systems. Unless otherwise stated, all estimates have been cleared following consultation with Member States and are published here as official WHO figures.
