Health problem addressed

Limited training and geographical isolation of laboratory technicians (and health workers in general) in remote, underserved areas severely affect quality of diagnosis, hence of control and therapy of many diseases. In most cases, diagnostic confirmation relies on slow, unaffordable, unpractical or inappropriate technologies.

Product description

Our solution allows to directly capture high quality images from optical eye piece of a microscope or other optical devices with a camera-integrated m-phone (with no additional adaptors or devices) and to send them as MMS via mobile phone network to distant diagnostic centres for prompt diagnosis or second opinion.

Product functionality

The m-phone with integrated camera functions as image transmission unit. It offers a possibility to connect basic health care facilities in remote areas with more specialised health care facilities in the field of medical image diagnostics.

Developer’s claims of product benefits

Existing integrated optical-digital devices and digital cameras, requiring a computer with access to broad band internet connection, are not readily available, bulky, complex to use and expensive, especially in low resourced contexts. Alternative ad hoc devices, such as microscopic optical extensions of m-phones and m-phone-to-microscope connectors are unnecessary and unpractical. Our solution presents a cheap, appropriate option, requiring only the existing microscope (or other optical instrument) and any camera-integrated m-phone with access to MMS network. User-friendly, readily available and easy to maintain, it represents an appropriate solution in most isolated settings.

Operating steps

The image of the field under observation is taken by slowly approaching the lens of the m-phone’s camera to the eyepiece of the microscope (or other optical instrument) until a satisfactory image is shown on the screen. Once taken, the picture is sent as an MMS to a distant diagnostic centre for second opinion.

Development stage

The application of the methodology to tele-microscopy has been first described by Bellina L. and Missoni E. in 2009. Subsequent field studies (Bellina L. and Missoni E. 2010) demonstrated its feasibility in most disadvantaged rural settings (Uganda and Bangladesh). Testing of further clinical applications is underway. Regulatory process: The technique relates to the combined use of existing and readily available products. The regulatory framework of those products applies.

Future work and challenges

The mobile diagnosis has to be integrated in the normal diagnostic procedures and data flow of local health systems including availability of expertise for remote second opinion and immediate feedback. Further studies are required for the development of the appropriate ITC network and management system.

Use and maintenance

User: Nurse, midwife, physician, technician
Training: Basic instructions (approach to light beam, centering image, avoiding external light interference, etc.) and less than half an hour trials for good results are needed.

Maintenance: Nurse, physician, technician

Product specifications

Consumables: None
Other features: Portable and reusable. Runs on batteries and is compatible with telemedicine systems.

Disclaimer
Eligibility for inclusion in the compendium has been evaluated by EuroScan member agencies and WHO. However, the evaluation by EuroScan member agencies and WHO has been solely based on a limited assessment of data and information submitted in the developers’ applications and, where available, of additional sources of evidence, such as literature search results or other publicly available information. There has been no rigorous review for safety, efficacy, quality, applicability, nor cost acceptability of any of the technologies. Therefore, inclusion in the compendium does not constitute a warranty of the fitness of any technology for a particular purpose. Besides, the responsibility for the quality, safety and efficacy of each technology remains with the developer and/or manufacturer. The decision to include a particular technology in the compendium is subject to change on the basis of new information that may subsequently become available to WHO. WHO will not be held to endorse nor to recommend any technology included in the compendium. Inclusion in the compendium solely aims at drawing stakeholders’ attention to innovative health technologies, either existing or under development, with a view to fostering the development and availability of, and/or access to, new and emerging technologies which are likely to be accessible, appropriate and affordable for use in low- and middle-income countries.
WHO does not furthermore warrant or represent that:
1. the list of new and emerging health technologies is exhaustive or error free; and/or that
2. the technologies which are included in the compendium will be embodied in future editions of the compendium; and/or that
3. the use of the technologies listed is, or will be, in accordance with the national laws and regulations of any country, including but not limited to patent laws; and/or that
4. any product that may be developed from the listed technologies will be successfully commercialized in target countries or that WHO will finance or otherwise support the development or commercialization of any such product.
WHO disclaims any and all liability and responsibility whatsoever for any injury, death, loss, damage or other prejudice of any kind whatsoever that may arise as a result of, or in connection with, the procurement, distribution and/or use of any technology embodied in the compendium, or of any resulting product and any future development thereof.
