GUIDELINES ON VALIDATION – APPENDIX 5 VALIDATION OF COMPUTERIZED SYSTEMS (May 2016)

DRAFT FOR COMMENTS

Should you have any comments on the attached text, please send these to Dr S. Kopp, Group Lead, Medicines Quality Assurance, Technologies, Standards and Norms (kopps@who.int) with a copy to Ms Marie Gaspard (gaspardm@who.int) by **12 July 2016**.

Medicines Quality Assurance working documents will be sent out electronically only and will also be placed on the Medicines website for comment under “Current projects”. If you do not already receive our draft working documents please let us have your email address (to bonnyw@who.int) and we will add it to our electronic mailing list.

25 © World Health Organization 2016

26 All rights reserved.

27 This draft is intended for a restricted audience only, i.e. the individuals and organizations having received this draft. The draft
28 may not be reviewed, abstracted, quoted, reproduced, transmitted, distributed, translated or adapted, in part or in whole, in any
29 form or by any means outside these individuals and organizations (including the organizations' concerned staff and member
30 organizations) without the permission of the World Health Organization. The draft should not be displayed on any website.

31 Please send any request for permission to:

32 Dr Sabine Kopp, Group Lead, Medicines Quality Assurance, Technologies, Standards and Norms, Regulation of Medicines and
33 other Health Technologies, Department of Essential Medicines and Health Products, World Health Organization, CH-1211
34 Geneva 27, Switzerland. Fax: (41-22) 791 4730; email: kopps@who.int.

35 The designations employed and the presentation of the material in this draft do not imply the expression of any opinion
36 whatsoever on the part of the World Health Organization concerning the legal status of any country, territory, city or area or of its
37 authorities, or concerning the delimitation of its frontiers or boundaries. Dotted lines on maps represent approximate border lines
38 for which there may not yet be full agreement.

39 The mention of specific companies or of certain manufacturers' products does not imply that they are endorsed or recommended
40 by the World Health Organization in preference to others of a similar nature that are not mentioned. Errors and omissions
41 excepted, the names of proprietary products are distinguished by initial capital letters.

42 All reasonable precautions have been taken by the World Health Organization to verify the information contained in this draft.
43 However, the printed material is being distributed without warranty of any kind, either expressed or implied. The responsibility
44 for the interpretation and use of the material lies with the reader. In no event shall the World Health Organization be liable for
45 damages arising from its use.

46 This draft does not necessarily represent the decisions or the stated policy of the World Health Organization.

SCHEDULE FOR THE PROPOSED ADOPTION PROCESS OF DOCUMENT QAS/16.667:
GUIDELINES ON VALIDATION – APPENDIX 5
VALIDATION OF COMPUTERIZED SYSTEMS

Discussion of proposed need for revision in view of the current trends in validation during informal consultation on data management, bioequivalence, GMP and medicines' inspection	29 June– 1 July 2015	56 57 58 59
Preparation of draft proposal for revision of the main text and several appendices by specialists in collaboration with the Medicines Quality Assurance Group and Prequalification Team (PQT)-Inspections, based on the feedback received during the meeting and from PQT-Inspections, draft proposals developed on the various topics by specialists, as identified in the individual working documents.	July 2015– April 2016	60 61 62 63 64 65 66 67
Presentation of the progress made to the fiftieth meeting of the WHO Expert Committee on Specifications for Pharmaceutical Preparations	12–16 October 2015	68 69 70
Discussion at the informal consultation on good practices for health products manufacture and inspection, Geneva	4–6 April 2016	71 72
Preparation of revised text by Mrs M. Cahilly and Dr A.J. van Zyl, participants at the above-mentioned consultation, based on Mrs Cahilly's initial proposal and the feedback received during and after the informal consultation by the meeting participants and members of PQT-Inspections	May 2016	73 74 75 76 77
Circulation of revised working document for public consultation	May 2016	78 79
Consolidation of comments received and review of feedback	August–September 2016	80 81
Presentation to the fifty-first meeting of the WHO Expert Committee on Specifications for Pharmaceutical Preparations	17–21 October 2016	82 83 84
Any other follow-up action as required	...	85 86

87

88
89

90 **Background information**

91
92 The need for revision of the published *Supplementary guidelines on good manufacturing*
93 *practices: validation* (World Health Organization (WHO) Technical Report Series, No. 937,
94 2006, Annex 4) (1) was identified by the Prequalification of Medicines Programme and a draft
95 document was circulated for comment in early 2013. The focus of the revision was the Appendix
96 on non-sterile process validation (Appendix 7), which had been revised and was adopted by the
97 Committee at its forty-ninth meeting in October 2014 (2).

98
99 The main text was sent out for consultation as *Working document QAS/15.639* entitled
100 “*Guidelines on Validation*” which constitute the general principles of the new guidance on
101 validation.

102
103 The draft on the specific topics, the appendices to this main text, will follow. One of them, i.e.
104 the ***Validation of computerized systems***, constitutes this working document.

105
106 The following is an overview on the appendices that are intended to complement the general text
107 on validation:

108
109 *Appendix 1*

110 *Validation of heating, ventilation and air-conditioning systems*

111 → will be replaced by cross-reference to WHO Guidelines on GMP for HVAC systems
112 for considerations in qualification of HVAC systems
113 (update - working document QAS/15.639/Rev.1) (2)

114
115 *Appendix 2*

116 *Validation of water systems for pharmaceutical use*

117 → will be replaced by cross-reference to *WHO Guidelines on water for pharmaceutical*
118 *use for consideration in qualification of water purification systems* (3)

119
120 *Appendix 3*

121 *Cleaning validation* – consensus to retain

122
123 *Appendix 4*

124 *Analytical method validation* – update in process

125
126 ***Appendix 5***

127 ***Validation of computerized systems*** – updated text proposed in this working document

128
129 *Appendix 6*

130 *Qualification of systems and equipment* – update in process

131
132 *Appendix 7*

133 *Non-sterile process validation* – update already published as Annex 3, WHO Technical Report
134 *Series, No. 992, 2015*

Draft for comment

168 **1. INTRODUCTION AND SCOPE**

169

170 1.1 Computerized systems should be validated at the level appropriate for their intended use
171 and in accordance with quality risk management principles. This applies to systems used in all
172 good (anything) practices (GXP) activities (e.g. good clinical practice (GCP), good
173 laboratory practice (GLP) and good manufacturing practices (GMP)) (3).

174

175 1.2 The purpose of validation of a computerized system is to ensure an acceptable degree of
176 documented evidence that establishes confidence in the accuracy, reliability and consistency in
177 performance of the system in accordance with predetermined specifications. The validation data
178 should meet the principles of being attributable, legible, contemporaneous, original and accurate
179 (ALCOA) throughout the data life cycle.

180

181 1.3 Computerized system validation should ensure that all necessary technical and
182 procedural controls are implemented ensuring compliance with good documentation practices
183 for electronic data generated by the system (WHO guidance on good data and record
184 management practices, WHO Technical Report Series, No. 996, Annex 5, 2016) (4).

185

186 1.4 System elements that need to be considered in computerized system validation include
187 computer hardware and software, related equipment and network components and operating
188 system environment, procedures and systems documentation including user manuals and people
189 (such as, but not limited to, users, data reviewers, system application administrators, network
190 engineers, database administrators and people involved in archiving). Computerized system
191 validation activities should address both system configuration as well as any custom-developed
192 elements.

193

194 1.5 Computerized systems should be maintained in the validated state with risk-based
195 controls appropriate to the different stages of the system life cycle. These stages include system
196 planning, specification, programming and configuration, system testing, preparation and
197 verification of standard operating procedures (SOPs) and training programmes, system
198 operation and maintenance including handling of software and hardware updates, monitoring
199 and review, followed by system retirement.

200

201 1.6 Depending on the types of systems or typical applications such as process control
202 systems (distributed control system (DCS), programmable logic controller (PLC), supervisory
203 control and data acquisition (SCADA)), laboratory information management systems (LIMS),
204 laboratory instrument control systems and business systems (enterprise resource planning
205 (ERP), manufacturing resource planning (MRP II)) used by the manufacturer, a document
206 covering (but not limited to) the following information should be available on-site:

207

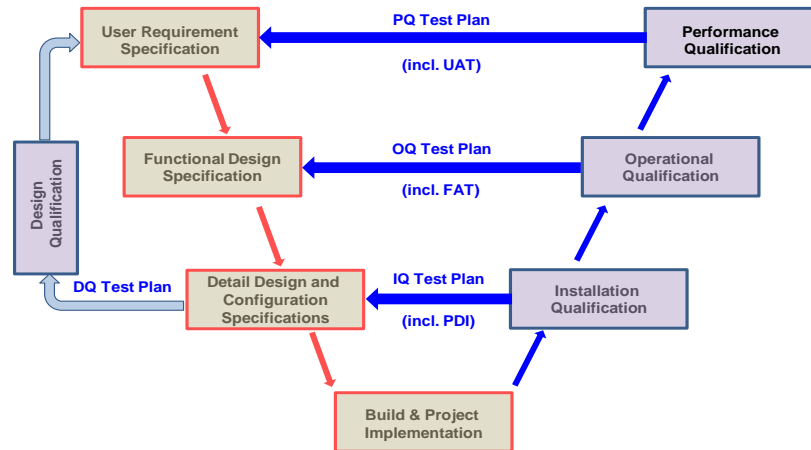

- 208 • purpose and scope;
- 209 • roles and responsibilities;
- 210 • validation approach;
- 211 • risk management principles;
- 212 • system acceptance criteria;
- 213 • vendor selection and assessment;
- 214 • computerized system validation steps;
- 215 • configuration management and change control procedures;
- 216 • back-up and recovery;
- 217 • error handling and corrective action;
- 218 • contingency planning and disaster recovery;
- 219 • maintenance and support;
- 220 • system requirement;
- 221 • validation deliverables and documentation;
- 222 • template, formats, annex; examples.

223

224 1.7 A typical model for computerized systems validation is the V-model. The lifecycle
225 development model (or V-model for short), is a framework or structure for undertaking the
226 design, execution and commissioning of a design project (see also International Society for
227 Pharmaceutical Engineering (ISPE) Baseline: a risk based approach to compliant GXP
228 computerized systems GAMP). The left-hand edge of the V is where the project is defined and
229 specified in greater detail. The bottom point of the V is the execution step of the project. The
230 right-hand edge of the V is where the commissioning and qualification testing of the installed
231 system is performed. The V-model provides a logical sequence that helps to organize the
232 complex activities of defining a project scope, executing it and qualifying it.

233

V-Model for Direct Impact Systems

234

235

2. GLOSSARY

236

237

238

239

240

241

242

243

244

245

246

247

248

249

250

251

252

253

254

255

archival. Archiving is the process of protecting records from the possibility of being further altered or deleted, and storing these records under the control of independent data management personnel throughout the required retention period. Archived records should include, for example, associated metadata and electronic signatures.

audit trail. The audit trail is a form of metadata that contains information associated with actions that relate to the creation, modification or deletion of GXP records. An audit trail provides for secure recording of life-cycle details such as creation, additions, deletions or alterations of information in a record, either paper or electronic, without obscuring or overwriting the original record. An audit trail facilitates the reconstruction of the history of such events relating to the record regardless of its medium, including the “who, what, when and why” of the action.

For example, in a paper record, an audit trail of a change would be documented via a single-line cross-out that allows the original entry to remain legible and documents the initials of the person making the change, the date of the change and the reason for the change, as required to substantiate and justify the change. In electronic records, secure, computer-generated, time-stamped audit trails should allow for reconstruction of the course of events relating to the creation, modification and deletion of electronic data. Computer-generated audit trails should

256 retain the original entry and document the user identification, the time/date stamp of the action,
257 as well as the reason for the change, as required to substantiate and justify the action. Computer-
258 generated audit trails may include discrete event logs, history files, database queries or reports or
259 other mechanisms that display events related to the computerized system, specific electronic
260 records or specific data contained within the record.

261
262 **backup.** A backup means a copy of one or more electronic files created as an alternative
263 in case the original data or system are lost or become unusable (for example, in the event of a
264 system crash or corruption of a disk). It is important to note that backup differs from archival in
265 that back-up copies of electronic records are typically only temporarily stored for the purposes of
266 disaster recovery and may be periodically overwritten. Such temporary back-up copies should
267 not be relied upon as an archival mechanism.

268
269 **business continuity plan.** A written plan that is documented and maintained that defines
270 the ongoing process supported by management and funded to ensure that the necessary steps are
271 taken to identify the impact of potential losses, maintain viable recovery strategies and recovery
272 plans, and ensure the continuity of services through personnel training, plan testing and
273 maintenance.

274
275 **change control.** The process of assuring that a computerized system remains validated
276 following a change. It includes assessing the impact of the change to determine when and if
277 repetition of a validation or verification process or specific portion of it is necessary and
278 performing appropriate activities to ensure the system remains in a validated state.

279
280 **cloud based.** Comments invited.

281
282 **computerized system.** A computerized system collectively controls the performance of
283 one or more automated processes and/or functions. It includes computer hardware, software,
284 peripheral devices, networks and documentation, e.g. manuals and standard operating
285 procedures, as well as the personnel interfacing with the hardware and software, e.g. users and
286 information technology
287 support personnel.

288
289 **computerized systems validation.** Means confirmation by examination and provision of
290 objective evidence that computer system specifications conform to user needs and intended uses
291 and that all requirements can be consistently fulfilled.

292
293 **configuration management.** A discipline applying technical and administrative direction
294 and surveillance to identify and document the functional and physical characteristics of a

295 configuration item, control changes to those characteristics, record and report change processing
296 and implementation status and verifying compliance with specified requirements.

297

298 **COTS.** Commercial off-the-shelf software; a vendor-supplied software component of a
299 computerized system for which the user cannot claim complete software life-cycle control.

300

301 **data.** Data means all original records and true copies of original records, including source
302 data and metadata and all subsequent transformations and reports of these data, which are
303 generated or recorded at the time of the GXP activity and allow full and complete reconstruction
304 and evaluation of the GXP activity. Data should be accurately recorded by permanent means at
305 the time of the activity. Data may be contained in paper records (such as worksheets and
306 logbooks), electronic records and audit trails, photographs, microfilm or microfiche, audio- or
307 video-files or any other media whereby information related to GXP activities is recorded.

308

309 **data governance.** The totality of arrangements to ensure that data, irrespective of the
310 format in which they are generated, are recorded, processed, retained and used to ensure a
311 complete, consistent and accurate record throughout the data life cycle.

312

313 **data integrity.** Data integrity is the degree to which data are complete, consistent,
314 accurate, trustworthy and reliable and that these characteristics of the data are maintained
315 throughout the data life cycle. The data should be collected and maintained in a secure manner,
316 such that they are attributable, legible, contemporaneously recorded, original or a true copy and
317 accurate. Assuring data integrity requires appropriate quality and risk management systems,
318 including adherence to sound scientific principles and good documentation practices.

319

320 **data life cycle.** All phases of the process by which data are created, recorded, processed,
321 reviewed, analysed and reported, transferred, stored and retrieved and monitored until retirement
322 and disposal. There should be a planned approach to assessing, monitoring and managing the
323 data and the risks to those data in a manner commensurate with potential impact on patient
324 safety, product quality and/or the reliability of the decisions made throughout all phases of the
325 data life cycle.

326

327 **disaster recovery.** Process for planning or engaging appropriate resources to restore the
328 normal business function in the event of a disaster.

329

330 **dynamic record format.** Records in dynamic format, such as electronic records, that
331 allow for an interactive relationship between the user and the record content. For example,
332 electronic records in database formats allow the user to track, trend and query data;
333 chromatography records maintained as electronic records allow the user (with proper access
334 permissions) to reprocess the data and expand the baseline to view the integration more clearly.

335

336 **functional specifications.** The functional specifications document, if created, defines
337 functions and technological solutions that are specified for the computerized system based upon
338 technical requirements needed to satisfy user requirements (e.g. specified bandwidth required to
339 meet the user requirement for anticipated system usage).

340

341 **good documentation practices.** In the context of these guidelines, good documentation
342 practices are those measures that collectively and individually ensure documentation, whether
343 paper or electronic, is secure, attributable, legible, traceable, permanent, contemporaneously
344 recorded, original and accurate.

345

346 **GXP.** Acronym for the group of good practice guides governing the preclinical, clinical,
347 manufacturing, testing, storage, distribution and post-market activities for regulated
348 pharmaceuticals, biologicals and medical devices, such as good laboratory practices, good
349 clinical practices, good manufacturing practices, good pharmacovigilance practices and good
350 distribution practices.

351

352 **installation qualification or installation verification testing.** Documented verification
353 that a system is installed according to written specifications for design and configuration.

354

355 **master data.** Comments invited.

356

357 **metadata.** Metadata are data about data that provide the contextual information required
358 to understand those data. These include structural and descriptive metadata. Such data describe
359 the structure, data elements, interrelationships and other characteristics of data. They also permit
360 data to be attributable to an individual. Metadata necessary to evaluate the meaning of data
361 should be securely linked to the data and subject to adequate review. For example, in weighing,
362 the number 8 is meaningless without metadata, i.e. the unit, mg. Other examples of metadata
363 include the time/date stamp of an activity, the operator identification (ID) of the person who
364 performed an activity, the instrument ID used, processing parameters, sequence files, audit trails
365 and other data required to understand data and reconstruct activities.

366

367 **operational qualification or operational/functional verification testing.** Documented
368 verification that a system operates according to written operational specifications throughout
369 specified operating ranges.

370

371 **performance qualification or performance/requirements verification testing.**
372 Documented verification that a system is capable of performing or controlling the activities of
373 the processes it is required to perform, according to written user requirements and specifications,
374 in its intended business and computing environment.

408
409
410
411
412
413
414

production environment. The business and computing operating environment in which a computerized system is used by end-users. For regulated computerized systems, the production environment is the business and computing operating environment in which the computerized system is being used for good laboratory practice-regulated purposes.

regression analysis and testing. A software verification and validation task to determine the extent of verification and validation analysis and testing that must be repeated when changes are made to any previously examined software component or system.

static record format. A static record format, such as a paper or PDF record, is one that is “fixed” and allows no or very limited interaction between the user and the record content. For example, once printed or converted to static PDFs, chromatography records lose the capability of being reprocessed or enabling more detailed viewing of baselines or any hidden fields.

system life cycle. The period of time that starts when a computerized system is conceived and ends when the product is no longer available for use by end-users. The system life cycle typically includes a requirements and planning phase; a development phase that includes: a design phase and a programming and testing phase; and a system qualification and release phase that includes: system integration and testing phase; system validation phase; system release phase; and a system operation and maintenance phase; and a system retirement phase.

user acceptance testing. Verification of the fully-configured computerized system installed in the production environment (or in a validation environment equivalent to the production environment) to perform as intended in the automated business process when operated by end-users trained in end-user standard operating procedures (SOPs) that define system use and control. User-acceptance testing may be a component of the performance qualification (PQ) or a validation step separate from the PQ.

user requirements specification. The user requirements specification (URS), if prepared as a separate document, is a formal document that defines the requirements for use of the software system in its intended production environment.

verification. The act of reviewing, inspecting, testing, checking, auditing or otherwise establishing and documenting whether or not items, processes, services or documents conform to specified requirements.

415 **3. COMPUTERIZED SYSTEM VALIDATION MASTER PLAN, PROTOCOLS**
416 **AND REPORTS**

417

418 3.1 There should be a computerized system validation master plan that describes the policy,
419 approach, organization and planning, resources, execution and management of computerized
420 system validation for all of the GXP systems in use on-site.

421

422 3.2 The computerized system validation master plan (CSVMP) should contain, for example,
423 the scope, risk management approach and a complete inventory list of all GXP systems. The
424 CSVMP should also outline the controls including but not limited to backup and recovery of
425 data, contingency planning, disaster recovery, change control management, configuration
426 management, error handling, maintenance and support, corrective measures and system access
427 control policies, that will be in place to maintain the validated state of the systems.

428

429 3.3 The CSVMP should refer to protocols and reports as appropriate, for the conduct of
430 validation.

431

432 3.4 Where appropriate, computerized systems should be classified based on risk assessment
433 relating to their GXP impact.

434

435 **Validation protocol**

436

437 3.5 Validation should be executed in accordance with the validation protocol and applicable
438 SOPs.

439

440 3.6 A validation protocol should define the validation strategy, including roles and
441 responsibilities and documentation and activities to be performed. The protocol should cover the
442 specification, development, testing, review and release of the computerized system for GXP use.

443

444 3.7 The validation protocol should be tailored to the system type, impact, risks and
445 requirements applicable to the system in which it will be used.

446

447 **Validation report**

448

449 3.8 A validation summary report should be prepared, summarizing system validation
450 activities.

451

452 3.9 It should outline the validation process and activities and describe and justify any
453 deviations from the process and activities specified in the protocol.

454

455 3.10 The report should include all critical and major test discrepancies that occurred during
456 the verification/validation testing and describe how these were resolved.

457

458 3.11 The report should be approved after the resolution of any issue identified during validation
459 and the system should then be released and ready for GXP use.

460

461 **4. VENDOR MANAGEMENT**

462

463 4.1 For vendor-supplied and/or vendor-managed computerized systems or system
464 components, including cloud-based systems, an evaluation of the vendor-supplied system and
465 the vendor's quality systems should be conducted and recorded. The scope and depth of this
466 evaluation should be based upon risk management principles.

467

468 4.2 Vendor evaluation activities may include: completion of an audit checklist by the
469 vendor; gathering of vendor documentation related to system development, testing and
470 maintenance including vendor procedures, specifications, system architecture diagrams, test
471 evidence, release notes and other relevant vendor documentation; and/or on-site audit of the
472 vendor facilities to evaluate and continuously monitor as necessary the vendor's system life-
473 cycle control procedures, practices and documentation.

474

475 4.3 Appropriate quality agreements should be in place with the vendor defining the roles and
476 responsibilities and quality procedures throughout the system life cycle.

477

478 **5. REQUIREMENTS SPECIFICATIONS**

479

480 5.1 Requirements specifications should be written to document the minimum user
481 requirements and functional or operational requirements and performance requirements.
482 Requirements may be documented in separate URS and functional requirements specifications
483 (FRS) documents or in a combined document.

484

485 **User requirements specifications**

486

487 5.2 The authorized URS document, or equivalent, should state the intended uses of the
488 proposed computerized system and should define critical data and data life-cycle controls that will
489 assure consistent and reliable data throughout the processes by which data is created, processed,
490 transmitted, reviewed, reported, retained and retrieved and eventually disposed.

491

492 5.3 The URS should include requirements to ensure that the data will meet regulatory
493 requirements such as ALCOA principles and WHO guidelines on good documentation practices.

494

- 495 5.4 Other aspects that should be specified include, but are not limited to, those related to:
496
- 497 • the data to be entered, processed, reported, stored and retrieved by the system, including
498 any master data and other data considered to be the most critical to system control and data output;
 - 499 • the flow of data including that of the business process(es) in which the system will be
500 used as well as the physical transfer of the data from the system to other systems or
501 network components. Documentation of data flows and data process maps are
502 recommended to facilitate the assessment and mitigation and control of data integrity
503 risks across the actual, intended data process(es);
 - 504 • networks and operating system environments that support the data flows;
 - 505 • how the system interfaces with other systems and procedures;
 - 506 • the limits of any variable and the operating programme and test programme.
 - 507 • synchronization and security control of time/date stamps;
 - 508 • technical and procedural controls of both the application software as well as
509 operating systems to assure system access only to authorized persons;
 - 510 • technical and procedural controls to ensure that data will be attributable to unique
511 individuals (for example, to prohibit use of shared or generic login credentials);
 - 512 • technical and procedural controls to ensure that data is legibly and
513 contemporaneously recorded to durable (“permanent”) media at the time of each step
514 and event and controls that enforce the sequencing of each step and event (for
515 example, controls that prevent alteration of data in temporary memory in a manner
516 that would not be documented);
 - 517 • technical and procedural controls that assure that all steps that create, modify or
518 delete electronic data will be recorded in independent, computer-generated audit
519 trails or other metadata or alternate documents that record the “what” (e.g. original
520 entry), “who” (e.g. user identification), “when” (e.g. time/date stamp) and “why”
521 (e.g. reason) of the action;
 - 522 • backups and the ability to restore the system and data from backups;
 - 523 • the ability to archive and retrieve the electronic data in a manner that assures that the
524 archive copy preserves the full content of the original electronic data set, including
525 all metadata needed to fully reconstruct the GXP activity. The archive copy should
526 also preserve the meaning of the original electronic data set, including its dynamic
527 format that would allow the data to be reprocessed, queried and/or tracked and
528 trended electronically as needed;
 - 529 • input/output checks, including implementation of procedures for the review of
530 original electronic data and metadata, such as audit trails;
 - 531 • technical and procedural controls for electronic signatures;
 - 532 • alarms and flags that indicate alarm conditions and invalid and altered data in order
533 to facilitate detection and review of these events;

- 534 • system documentation, including system specifications documents, user manuals and
- 535 procedures for system use, data review and system administration;
- 536 • system capacity and volume requirements based upon the predicted system usage and
- 537 performance requirements;
- 538 • performance monitoring of the system;
- 539 • controls for orderly system shutdown and recovery;
- 540 • business continuity.

541
542 *Note: For specific applications, in addition to general requirements, the URS should*

543 *have specific requirements.*

544

545 5.5 User requirements should be related to the tests carried out in the qualification phase

546 (typically either the operation qualification (OQ) or the PQ)

547

548 5.6 In the case of, e.g. a chromatography data system (CDS), it is further important to define

549 the requirements for the basic functions of taking into account following details:

550

- 551 – requirements for hardware, workstations and operating systems;
 - 552 – system requirements such as number of users, locations;
 - 553 – compliance requirements, i.e. open or closed system, security and access
 - 554 configuration, data integrity, time and date stamp, electronic signature and data
 - 555 migration;
 - 556 – workflow of CDS;
 - 557 – information technology (IT) support requirements;
 - 558 – interface requirements.
- 559

560 **Functional specifications**

561

562 5.7 The functional specifications should define specific functions of the computerized

563 system based upon technical requirements needed to satisfy user requirements.

564

565 5.8 The functional specifications provide a basis for the system design and configuration

566 specifications. Functional specifications should consider requirements for operation of the

567 computerized system in the intended computing environment, such as network infrastructure

568 requirements, as well as functions provided by vendor-supplied software as well as functions

569 required for user business processes that are not met by out-of-the-box software functionality

570 and default configurations and that will require custom code development.

571

572 5.9 With regard to the proper functioning of computer software, the following general

573 aspects should be kept in mind when specifying installation and user/functional requirements:

- 574
- 575 – language, name, function (purpose of the programme);
- 576 – inputs;
- 577 – outputs, including electronic data and metadata that constitute the “original records”;
- 578 – fixed set point (process variable that cannot be changed by the operator);
- 579 – variable set point (entered by the operator);
- 580 – edits (reject input/output that does not conform to limits and minimize errors);
- 581 – input processing parameters (and equations);
- 582 – programme overrides (e.g. to stop a mixer before time).
- 583

584 5.10 The personnel access roles who have the ability and/or are authorized to write, alter or

585 have access to programmes should be identified. There should be appropriate segregation of

586 roles between personnel responsible for the business process and personnel in system

587 administration and maintenance roles who will have the ability to alter critical master data,

588 critical set points, and system policies and configuration settings.

589

590 5.11 With regard to the proper functioning of computer hardware and to prevent damage, the

591 following general aspects should be kept in mind when specifying installation and functional

592 requirements:

593

- 594 – location;
- 595 – power supply;
- 596 – environmental conditions;
- 597 – magnetic disturbances;
- 598 – mechanical disturbances;
- 599 – physical security.
- 600

601 **6. SYSTEM DESIGN AND CONFIGURATION SPECIFICATIONS**

602

603 6.1 System design and configuration specifications should be developed based on user and

604 functional requirements. Specification of design parameters and configuration settings (separate

605 or combined) should ensure data integrity and compliance with “good documentation practices

606 for electronic data”.

607

608 6.2 System design and configuration specifications should provide a high-level system

609 description as well as an overview of the system physical and logical architecture and should

610 map out the automated system business process and relevant work flows and data flows if these

611 have not already been documented in other requirements specifications documents.

612

613 6.3 The system design and configuration specifications may include, as applicable,

614 specifications to define design of software code, for software code that is developed in-house, if
615 any, and configuration specifications of configurable elements of the software application, such
616 as security profiles, audit trail configuration, data libraries and other configurable elements.

617
618 6.4 In addition, the system design and configuration specifications may also include, based
619 upon risk, the hardware design and configuration specifications as well as that of any supporting
620 network infrastructure.

621
622 6.5 Example configuration settings and design controls for good documentation practices that
623 should be enabled and managed across the computing environment (for both the software
624 application, including off-the-shelf software, and operating systems environments) include, but
625 are not limited to:

626

- 627 • restricting security configuration settings for system administrators to independent
- 628 persons, where technically feasible;
- 629 • disabling configuration settings that allow overwriting and reprocessing of data
- 630 without traceability;
- 631 • disabling use of “hidden fields” and the ability to delete data and the ability to
- 632 obscure data with data annotation tools;
- 633 • restricting access to time/date stamps;
- 634 • for systems to be used in clinical trials, configuration and design controls should be
- 635 implemented to protect the blinding of the trial, for example, by restricting access
- 636 to who can view randomization data that may be stored electronically.

637
638 6.6 System design and configuration specifications should include secure, protected,
639 independent computer-generated audit trails to track changes to these settings in the system.

640

641 **7. DESIGN QUALIFICATION**

642

643 7.1 A design review should be conducted to verify that the proposed design and
644 configuration of the system is suitable for its intended purpose and will meet all applicable user
645 and functional requirements specifications.

646

647 7.2 This process that may be referred to as design qualification, may include a review of
648 vendor documentation, if applicable, and verification that requirements specifications are
649 traceable to proposed design and configuration specifications.

650

651 **8. BUILD AND PROJECT IMPLEMENTATION**

652

653 8.1 Once the system requirements and the system design and configuration are specified and

654 verified, system development or “build and test” activities may begin. The development
655 activities may occur as a dedicated phase following completion of specification of system
656 requirements and design and configuration (such as when adhering to a sequential or “waterfall”
657 development model). Alternatively, development activities may occur iteratively as
658 requirements are specified and verified (such as when prototyping or rapid-development
659 methodologies are employed).

660

661 **Vendor-supplied systems**

662

663 8.2 For vendor-supplied systems, development controls for the vendor-supplied portion of
664 the computerized system should be assessed during the vendor evaluation or supplier
665 qualification. For custom-built systems and configurable systems, as well as for vendor-supplied
666 systems that include custom components (such as custom-coded interfaces or custom report
667 tools) and/or require configuration (such as configuration of security profiles in the software or
668 configuration of the hardware within the network infrastructure), the system should be
669 developed under an appropriate documented quality management system.

670

671 **Custom-developed systems**

672

673 8.3 For custom-developed systems or modules, the quality management system controls
674 should include development of code in accordance with documented programming standards,
675 review of code for adherence to programming standards and design specifications, and
676 development testing that may include unit testing and module/integration testing.

677

678 8.4 System prototyping and rapid, agile development methodologies may be employed
679 during the system build and development testing phase. There should be an adequate level of
680 documentation of these activities.

681

682 **Preparation for the system qualification phases**

683

684 8.5 The system development and build phase should be followed by the system qualification
685 phase. This typically consists of installation, operational and performance testing, but actual
686 qualification required may vary depending on the scope of the validation project as defined in
687 the validation plan and based upon a documented and justified risk assessment.

688

689 8.6 Prior to the initiation of the system qualification phase, the software program and
690 requirements and specifications documents should be finalized and subsequently managed under
691 formal change control.

692

693 8.7 Persons who will be conducting the system qualification should be trained to adhere to

694 the following requirements for system qualification:
695

- 696 • test documentation should be generated to provide evidence of testing;
- 697 • test documentation should comply with good documentation practices;
- 698 • any discrepancies between actual test results and expected results should be
699 documented and adequately resolved based upon risk prior to proceeding to
700 subsequent test phases.

701

702 **9. INSTALLATION QUALIFICATION**

703

704 9.1 The first phase of system testing is installation qualification (IQ), also referred to as
705 installation verification testing. IQ should provide documented evidence that the computerized
706 system, including software and associated hardware, is installed and configured in the intended
707 system testing and production environments according to written specifications.

708

709 9.2 The IQ will verify, for example, that the computer hardware on which the software
710 application is installed has the proper firmware and operating system; that all components are
711 present and in the proper condition; and that each component is installed per the manufacturer or
712 developer instructions.

713

714 9.3 IQ should include verification that configurable elements of the system are configured as
715 specified. Where appropriate, this could also be done during OQ.

716

717 **10. OPERATIONAL QUALIFICATION**

718

719 10.1 The OQ, or operational/functional verification testing, should provide documented
720 evidence that the software and hardware function as intended throughout anticipated operating
721 ranges.

722

723 10.2 Functional testing should include, based upon risk:

724

- 725 – an appropriate degree of challenge testing (such as boundary, range, limit, nonsense
726 entry testing) to verify the system appropriately handles erroneous entries or erroneous
727 use;
- 728 – verification that alarms are raised based upon alarm conditions;
- 729 – flags are raised to signal invalid or altered data.

730

731

732 **Considerations for functional testing of hardware and software**

733

734 *Note: the section below provides for examples, and is not an exhaustive list. Static, dust, power-*
735 *feed voltage fluctuations and electromagnetic interference could influence the system.*

736

737 **Hardware**

738

739 10.3 The extent of validation should depend on the complexity of the system. Appropriate
740 tests and challenges to the hardware should be performed as part of validation.

741

742 10.4 Hardware is considered to be equipment and the focus should be on location,
743 maintenance and calibration of hardware, as well as on qualification.

744

745 10.5 The qualification of the hardware should prove:

746

- 747 • that the capacity of the hardware matches its assigned function (e.g. foreign
748 language);
- 749 • that it operates within the operational limits (e.g. memory, connector ports, input
750 ports);
- 751 • that the hardware configuration settings are appropriate and meet user and functional
752 requirements;
- 753 • that it performs acceptably under challenging conditions (e.g. long hours,
754 temperature extremes);
- 755 • reproducibility/consistency.

756

757 10.6 Some of the hardware qualification may be performed by the computer vendor.
758 However, the ultimate responsibility for the suitability of equipment used remains with the
759 company.

760

761 10.7 Qualification protocols, reports (including data) should be kept by the company for the
762 hardware in its configured state. When qualification information is produced by an outside firm,
763 e.g. computer vendor, the records should be sufficiently complete (including general results and
764 protocols) to allow the company to assess the adequacy of the qualification and verification
765 activities. A mere certification of suitability from the vendor, for example, will be inadequate.

766

767 **Software**

768

769 10.8 Functional testing of software should provide assurance that computer programs
770 (especially those that control critical activities in manufacturing and processing) will function
771 consistently within pre-established limits for both normal conditions as well as under worst-case

772 conditions (e.g. out-of-limit, out-of-range, alarm conditions).
773

774 10.9 Functional testing, also known as “black box” testing, involves inputting normal and
775 abnormal test cases; then, evaluating outputs against those expected. It can apply to computer
776 software or to a total system (reference: CEFIC GMP).
777

778 **11. STANDARD OPERATING PROCEDURES AND TRAINING**

779
780 11.1 Prior to the conduct of the PQ and user acceptance testing (UAT), and prior to the
781 release of the computerized system for GXP use, there should be adequate written procedures
782 and documents and training programmes created defining system use and control. These may
783 include vendor-supplied user manuals as well as SOPs and training programmes developed in-
784 house.
785

786 11.2 Example procedures and training programmes that should be developed include, but are
787 not necessarily limited to:
788

- 789 • system use procedures that address:
 - 790 – routine operation and use of the system in the intended business process(es),
 - 791 – review of the electronic data and associated metadata (such as audit trails) and how the
 - 792 source electronic records will be reconciled with printouts, if any,
 - 793 – mechanisms for signing electronic data,
 - 794 – system training requirements prior to being granted system access;
- 795 • system administration procedures that address:
 - 796 – granting and disabling user access and maintaining security controls,
 - 797 – backup/restore,
 - 798 – archival/retrieval,
 - 799 – disaster recovery and business continuity,
 - 800 – change management,
 - 801 – incident and problem management,
 - 802 – system maintenance.

804 **12. PERFORMANCE QUALIFICATION AND USER ACCEPTANCE TESTING**

805
806 *Note: The user requirements specifications should provide a basis for UAT that will be*
807 *conducted by the system users during the PQ of the system.*
808

809 12.1 PQ, that includes UAT, should be conducted to verify the intended system use and
810 administration outlined in the URS, or equivalent document.
811

812 12.2 The PQ should be conducted in the production environment or in a validation
813 environment that is equivalent to the production environment in terms of overall software and
814 hardware configuration.

815
816 12.3 PQ testing should also include, as applicable, an appropriate degree of
817 stress/load/volume testing based upon the anticipated system use and performance requirements
818 in the production environment.

819
820 12.4 In addition, an appropriate degree of end-to-end or regression testing of the system
821 should be conducted to verify the system performs reliably when system components are
822 integrated in the fully-configured system deployed in the production environment.

823
824 12.5 UAT should be conducted by system users to verify the adequacy of system use SOPs
825 and data review SOP(s) and training programmes. The UAT should include verification of the
826 ability to readily discern invalid and altered data, including the ability to efficiently review
827 electronic data and metadata, such as audit trails.

828
829 12.6 IT system administrators should verify the adequacy of system administration SOP(s)
830 and controls that will be routinely executed during normal operational use and administration of
831 the system, including backup/restore and archival/retrieval processes.

832

833 **Legacy systems**

834
835 12.7 Comments invited.

836

837 **13. SYSTEM OPERATION AND MAINTENANCE**

838

839 **Security and access control**

840
841 13.1 Manufacturers should have systems and procedures in place to ensure security of data
842 and control access to computerized systems.

843
844 13.2 Suitable security systems should be in place to prevent unauthorized entry or
845 manipulation or deletion of data through both the application software as well as in operating
846 system environments in which data may be stored or transmitted. Data should be entered or
847 amended only by persons authorized to do so.

848
849 13.3 The activity of entering data, changing or amending incorrect entries and creating
850 backups should be done in accordance with SOPs.

851

852 13.4 Security should extend to devices used to store programs, such as tapes, disks and
853 magnetic strip cards or other means. Access to these devices should be controlled.

854

855 13.5 Procedures for review of metadata, such as audit trails, should define the frequency, roles
856 and responsibilities, and nature of these reviews.

857

858 13.6 Details on user profiles, access rights to systems, networks, servers, computer systems
859 and software should be documented and an up-to-date list on the individual user rights for the
860 software, individual computer systems and networks should be maintained and subjected to
861 change control. The level of detail should be sufficient to enable computer system validation
862 personnel, IT personnel/any external auditor/inspector to ascertain that security features of the
863 system and of software used to obtain and process critical data cannot be circumvented.

864

865 13.7 All GXP computerized systems in a company, either stand-alone or in a network, should
866 be monitored using an audit trail for the system that is configured to capture events that are
867 relevant. These events should include all elements that need to be monitored to ensure that the
868 integrity of the data could not have been compromised, such as but not limited to, changes in
869 data, deletion of data, dates, times, backups, archives, changes in user access rights,
870 addition/deletion of users and logins. The configuration and archival of these audit trails should
871 be documented and also be subjected to change control. These audit trails should be validated to
872 show that these cannot be modified in their archived form.

873

874 13.8 Actions, performance of the system and acquisition of data should be traceable and
875 identify the persons who made entries and or changes, approved decisions or performed other
876 critical steps in system use or control.

877

878 13.9 The entry of master data into a computerized system should be verified by an
879 independent authorized person and locked before release for routine use.

880

881 13.10 Validated computerized systems should be maintained in the validated state once
882 released to the GXP production environment.

883

884 13.11 There should be written procedures governing system operation and maintenance,
885 including for example:

886

- 887 • performance monitoring;
- 888 • change management and configuration management;
- 889 • problem management;
- 890 • programme and data security;
- 891 • programme and data backup/restore and archival/retrieval;

- 892 • system administration and maintenance;
- 893 • data flow and data life cycle;
- 894 • system use and review of electronic data and metadata (such as audit trails);
- 895 • personnel training;
- 896 • disaster recovery and business continuity;
- 897 • availability of spare parts and technical support;
- 898 • periodic re-evaluation.

899

900 13.12 Computerized systems should be periodically reviewed to determine whether the system
901 remains in a validated state or whether there is a need for revalidation. The scope and extent of
902 the revalidation should be determined using a risk-based approach. The review should at least
903 cover:

904

- 905 • review of changes;
- 906 • review of deviations;
- 907 • review of incidents;
- 908 • systems documentation;
- 909 • procedures;
- 910 • training;
- 911 • effectiveness of corrective and preventive action (CAPA).

912

913 13.13 CAPA should be taken where indicated as a result of the periodic review.

914

915 13.14 Automatic updates should be subject to review prior to becoming effective.

916

917 **14. SYSTEM RETIREMENT**

918

919 14.1 Once the computerized system or components are no longer needed, the system or
920 components should be retired in accordance with a change control procedure and formal plan for
921 retirement.

922

923 14.2 Retirement of the system should include decommissioning of the software and hardware,
924 retirement of applicable procedures as necessary. Measures should be in place to ensure the
925 electronic records are maintained and readily retrievable throughout the required records
926 retention period.

927

928 14.3 Records should be in a readable form and in a manner that preserves the content and
929 meaning of the source electronic records. For example, if critical quality and/or compliance data
930 need to be reprocessed after retirement of the system, the business owner may arrange for

931 migration of the critical records to a new system and for verification of correct reprocessing of
932 the data on the new system.

933
934 14.4 The outcome of the retirement activities, including traceability of the data and
935 computerized systems, should be presented in a report.
