5.6 EXTRACTABLE VOLUME FOR PARENTERAL PREPARATIONS

Final text for revision of *The International Pharmacopoeia*

This monograph was adopted at the Forty-sixth WHO Expert Committee on Specifications for Pharmaceutical Preparations in October 2011 for addition to the 4th Edition of the International Pharmacopoeia.

The text, reproduced with the permission of the European Pharmacopoeia with appropriate editorial modifications, is one that has undergone pharmacopoeial harmonization by the Pharmacopoeial Discussion Group (PDG) of the European Pharmacopoeia (Ph.Eur), Japanese Pharmacopoeia (JP) and United States Pharmacopeia (USP).

5.6 EXTRACTABLE VOLUME FOR PARENTERAL PREPARATIONS

Suspensions and emulsions must be shaken before withdrawal of the contents and before the determination of the density. Oily and viscous preparations may be warmed according to the instructions on the label, if necessary, and thoroughly shaken immediately before removing the contents. The contents are then cooled to 20 °C to 25 °C before measuring the volume.

**Single-dose containers**

Select one container if the nominal volume is 10 ml or more, three containers if the nominal volume is more than 3 ml and less than 10 ml, or five containers if the nominal volume is 3 ml or less. Take up individually the total contents of each container selected into a dry syringe of a capacity not exceeding three times the volume to be measured, and fitted with a 21-gauge needle not less than 2.5 cm in length. Expel any air bubbles from the syringe and needle, then discharge the contents of the syringe without emptying the needle into a standardized dry cylinder (graduated to contain rather than to deliver the designated volumes) of such size that the volume to be measured occupies at least 40 per cent of its graduated volume. Alternatively, the volume of the contents in millilitres may be calculated as the mass in grams divided by the density.

For containers with a nominal volume of 2 ml or less the contents of a sufficient number of containers may be pooled to obtain the volume required for the measurement provided that a separate, dry syringe assembly is used for each container. The contents of
containers holding 10 ml or more may be determined by opening them and emptying the contents directly into the graduated cylinder or tared beaker.

The volume is not less than the nominal volume in case of containers examined individually, or, in case of containers with a nominal volume of 2 ml or less, is not less than the sum of the nominal volumes of the containers taken collectively.

**Multidose containers**
For injections in multidose containers labelled to yield a specific number of doses of a stated volume, select one container and proceed as directed for single-dose containers using the same number of separate syringe assemblies as the number of doses specified. The volume is such that each syringe delivers not less than the stated dose.

**Cartridges and prefilled syringes**
Select one container if the nominal volume is 10 ml or more, three containers if the nominal volume is more than 3 ml and less than 10 ml, or five containers if the nominal volume is 3 ml or less. If necessary, fit the containers with the accessories required for their use (needle, piston, syringe) and transfer the entire contents of each container without emptying the needle into a dry tared beaker by slowly and constantly depressing the piston. Determine the volume in millilitres calculated as the mass in grams divided by the density.

The volume measured for each of the containers is not less than the nominal volume.

**Parenteral infusions**
Select one container. Transfer the contents into a dry measuring cylinder of such a capacity that the volume to be determined occupies at least 40 per cent of the nominal volume of the cylinder. Measure the volume transferred.

The volume is not less than the nominal volume.
