PSYCHOACTIVE SUBSTANCE USE AMONG ADOLESCENTS IN THE WHO AFRICAN REGION

Prevalence of alcohol-related problems during lifetime

The figure below is based on data from the WHO Global School-based Student Health Survey (GSHS) and presents data of 13-15 year old students living in fourteen countries in the WHO African Region. It shows the percentage of male and female students who felt sick, got into trouble with family or friends, missed school or got into fights as a result of their drinking during their lifetime.

Prevalence (%) of alcohol-related problems during lifetime in the WHO African Region

GSIS data was conducted between 2004-2009 with a national representative sample of school students (13-15 year old). Subnational data was used for the following countries due to lack of national data at time of publication: Tanzania and Zimbabwe.

This fact sheet was developed jointly by the WHO Surveillance and Population-based Prevention team, Department of Chronic Diseases and Health Promotion and the WHO Management of Substance Abuse Team, Department of Mental Health and Substance Abuse.
