

Safety and feasibility study of the Odon device for assisted vaginal delivery

Current Project Brief

Objectives and Background

To evaluate the safety and feasibility of the Odon device in assisting vaginal delivery in singleton term pregnancies under non-emergency conditions during the second stage of labour. In terms of safety, the study aims to assess potential maternal and fetal trauma and signs of fetal/newborn distress. Feasibility will be assessed by observing successful expulsion of the fetal head with the device.

Geographic location

Argentina, Kenya, South Africa

Main deliverables

Enrolment of a total planned of 108 women with Odon device. Early terminated study with 49 women enrolled in Argentina (2011-2015) and South Africa (2017). Results will be published in a peer-reviewed journal.
