FIJI

Recorded adult per capita consumption (age 15+)

Sources: FAO (Food and Agriculture Organization of the United Nations), World Drink Trends 2003

Abstainers

The same survey also found the rate of daily drinkers to be 1.4% among males and 0.8% among females aged 12 years and over.1

Estimates from key alcohol experts show that the proportion of adult males and females who had been abstaining (last year before the survey) was 74% (males) and 98% (females). Data is for after year 1995.2

Youth drinking (abstainers)

Data from the 1993 national nutrition survey. Males $n = 292$ and females $n = 314$; aged between 12 and 17 years.1
Traditional alcoholic beverages
In Fiji, as in the other Pacific nations, consumption of alcoholic home brews is widespread. These beverages usually contain up to three times the alcohol content of commercially produced beer and are mostly drunk by younger men.\(^1\)

Unrecorded alcohol consumption
The unrecorded alcohol consumption in Fiji is estimated to be 1.0 litre pure alcohol per capita for population older than 15 for the years after 1995 (estimated by a group of key alcohol experts).\(^2\)

Morbidity, health and social problems from alcohol use
In Fiji, in 1991, one third of admissions and 74% of injury presentations were alcohol-related.\(^4\)

Alcohol abuse was a factor in roughly 58% of all homicides that occurred between 1982 to 1992. Over half of the crimes committed over a two-year period from 1974 through 1976 were, according to the offenders, committed while under the influence of alcohol. A recent survey shows escalation in the figures indicating that 80% of all crimes in Fiji are alcohol-related. It is also reported that almost all the offenders blame alcohol as the reason for the committing of their crime.\(^5\)

Research shows that single drinking sessions with a heavy rate of alcohol intake (a common practice among Fijian youth) can cause symptoms of abrupt mood swings resulting in violence, accidents and fights, exaggerated emotions, uncharacteristic behaviour, memory loss, impaired judgement, communication problems, sleepiness, coma, stupor and death (at very high intakes) and suicide attempts. Binge drinking can also trigger schizophrenic and other psychiatric episodes.\(^5\)
