Between 2005 and 2011 implementation of the collaborative TB/HIV activities saved an estimated 1.3 million lives but much more needs to be done to achieve universal access to these life-saving measures and to eliminate HIV-associated TB deaths.

Routine HIV testing should be offered to all patients with presumptive and diagnosed TB. Globally in 2013, 48% of TB patients (2.9 million) had a documented HIV test, up from 46% (2.8 million in 2012).

Both antiretroviral therapy (ART) and co-trimoxazole preventive therapy (CPT) should be given to all TB patients living with HIV, irrespective of their CD4 counts. Early ART given within 2-8 weeks after initiation of TB treatment is critical for reducing mortality. Of the TB patients who were known to be HIV-positive in 2013, 70% (364,000) were initiated on ART and 85% (431,000) on CPT.

The Three I's for HIV/TB (Intensified case finding for TB, Isoniazid preventive therapy (IPT), and Infection control) will reduce the burden of TB among people living with HIV and therefore must be urgently adopted by policy makers and implemented by all health facilities offering HIV care services.

The number of people living with HIV who were recorded to have been screened for active TB (an element of "intensified case finding") increased from 4.1 million in 2012 to 5.5 million in 2013. Among the 45 countries that reported data for 2013, IPT was provided to 586,000 people living with HIV, up from 520,000 receiving it in 2012. TB infection control measures are still not implemented in many HIV service settings.

Early diagnosis and timely treatment among people living with HIV are essential for minimizing TB associated mortality. WHO recommends use of Xpert MTB/RIF as the initial diagnostic test for people living with HIV who have TB signs and symptoms.
WHO works through wide consultation, offering evidence-based policy guidance that helps health officials, providers, affected communities, and supports donors to respond effectively to the threat of TB/HIV. The following guidance relating to HIV-associated TB has been published by WHO in collaboration with partners:

- **Three interlinked patient monitoring systems for HIV care/ART, MCH/PMTCT** (including malaria prevention during pregnancy), and TB/HIV: standardized minimum data set and illustrative tools (2013)
- **The consolidated guidelines on the use of antiretrovirals for the treatment and prevention of HIV infection** (2013)
- **WHO policy on collaborative TB/HIV activities** (2012)
- **Recommendations for investigating contacts of persons with infectious tuberculosis** in low- and middle-income countries (2012)
- **Technical and practical “how to” considerations for rapid implementation of the Xpert MTB/RIF diagnostic test** which includes an algorithm relating to the diagnosis of HIV associated TB (2011) and **Policy update: Xpert MTB/RIF assay for the diagnosis of pulmonary and extrapulmonary TB in adults and children** (2014)
- WHO led the design and costing of expanded TB/HIV and MDR-TB components within the Stop TB Partnership’s **Global Plan to Stop TB 2006-2015**, which has been replaced by the Global Plan to Stop TB 2011-2015
- **Guidelines on intensified case-finding and isoniazid preventive therapy for people living with HIV** in resource constrained settings (2010)
- **Priority research questions for TB/HIV in HIV prevalent and resource constrained settings**
- **A guide to monitoring and evaluation for collaborative TB/HIV activities** (2009), currently being updated.
- **WHO policy on TB infection control in health-care facilities**, congregate settings and households (2009)
- **Policy guidelines for collaborative HIV and TB services for injecting and other drug users** (2008) currently being updated.
- **TB care with TB/HIV co-management** (2007)

WHO monitors and evaluates global, regional and national control efforts, and, together with the TB/HIV Working Group shapes and stimulates global TB/HIV research.

WHO builds capacity by providing technical assistance and support to national initiatives to expand quality services and vital infrastructure for TB/HIV diagnosis and treatment.

WHO provides global and front-line support including training of national authorities, partners and consultants for faster response to expressed need. This is provided through WHO TB and HIV staff in six regional offices and 45 countries (although limited resources mean demand outstrips supply).

WHO strengthens collaboration so that a wider array of partners share lessons learnt thus solving operational problems and giving demand-driven support to countries and communities.

WHO provides the secretariat for the Global TB/HIV Working Group of the Stop TB Partnership.

WHO works with funding partners such as PEPFAR and The Global Fund and many HIV and TB technical agencies to increase support to high burden countries to scale-up implementation of TB/HIV collaborative activities. It also serves as the technical lead agency for TB/HIV of the UNAIDS co-sponsors.
