Scaling up prevention and treatment for TB and HIV

Global TB/HIV Working Group of the Stop TB Partnership

Addis Ababa, Ethiopia, 20–21 September 2004

The Fourth Working Group meeting was held on 20–21 September 2004 in Addis Ababa, Ethiopia, with the theme of “Two diseases – one patient: scaling up prevention and treatment for TB and HIV”. The Global TB/HIV Working Group advises WHO and the Stop TB Partnership on TB/HIV issues and aims to reduce the burden of TB and HIV in dually-affected populations. The TB/HIV Working Group has met yearly since 2001. Information and experience on a wide range of issues to ensure patient-centred quality TB/HIV care were shared among nearly 200 participants from almost 40 countries. Networking and partnership between the TB and HIV communities were forged in a forum environment to realize a more effective response to the global TB/HIV epidemic.
Progress – but more is needed

In opening the meeting, Gijs Elzinga, the chair of the Working Group (WG) since its inception, likened the WG to a thriving three-year-old child that has gained weight and reached many important developmental milestones. TB/HIV is now prominent on global health agendas, with celebrities such as Nelson Mandela advocating that, “we can’t fight AIDS unless we do much more to fight TB as well”. Collaboration between the TB and HIV communities is increasing at all levels. The WG has produced the minimum essential set of policy guidance to assist countries in implementing collaborative TB/HIV activities, and there is now global consensus on the importance of the 12 collaborative activities outlined in the Interim Policy on Collaborative TB/HIV Activities (http://whqlibdoc.who.int/hq/2004/WHO_HTM_TB_2004.330.pdf). The number of countries implementing collaborative TB/HIV activities is increasing rapidly.

Despite these efforts and achievements, the TB/HIV epidemic continues to accelerate not only in sub-Saharan Africa but also increasingly in Asia and Eastern Europe. The proportion of the population with access to the full package of collaborative TB/HIV activities in countries implementing the Interim Policy remains very low. Much more effort is needed to assist countries to implement collaborative TB/HIV activities.

Building bridges

The creation of an exciting new collaboration between the TB and HIV departments at WHO headquarters in Geneva was announced by Dr Mario Raviglione, Director of the Stop TB Department, and Dr Teguest Guerma, Associate Director of the HIV Department. The new HIV/TB Task Force (HTTF) will maximize collaboration between the two departments in order to accelerate coordinated antiretroviral therapy (ART) scale-up and DOTS expansion at country level.

But …

TB programmes are from Mars, HIV programmes are from Venus

The collaboration between TB and HIV programmes was likened to a marriage many times during the meeting. Like all relationships, it requires a lot of effort to make it successful. The different histories and cultures of the TB and HIV commu-
nities raise many challenges in achieving an effective and productive partnership. Experience from a TB/HIV project in Khayelitsha, South Africa, demonstrated some of these differences. TB services are geared towards chronic-care services with simple and standardized technical procedures, while HIV/AIDS services are clinically oriented and tend to be more individual-patient-oriented. Likewise, experience from Thailand highlighted the differences between the well staffed but poorly funded TB programme and the younger, more dynamic and well-funded HIV programme. Although collaboration exists on paper, the differences between the programmes are one of the main barriers to HIV-infected TB patients accessing ART.

The WG concluded that the differences between TB and HIV programmes need to be addressed at all levels, building on strengths and eliminating weaknesses, in order to ensure effective collaboration between the programmes and joint delivery of comprehensive services to coinfected patients. Where possible, providing this care in a “one-stop shop” should be the aim of the collaboration between TB and HIV programmes. Integration of the programmes is not necessary for this purpose.

**Why is more money still not buying us better health?**

In recent years, there has been an unprecedented increase in the resources available to tackle TB and HIV through the Global Fund to Fight AIDS, Tuberculosis and Malaria (GFATM), the US President’s Emer-
Two diseases – one patient

Treatment for both HIV and TB provides a lifeline to millions of coinfected people worldwide. Lucy Chesire, a Kenyan activist who has lived with HIV/AIDS for almost 10 years, shared her traumatic personal experience with TB and pleaded with the participants to accelerate patient-centred action in order to reduce the suffering and deaths of HIV-infected TB patients. TB and HIV programmes need to look beyond their rigid boundaries and take on expanded roles in order to deliver better prevention, treatment and support services for their clients.

The DOTS strategy alone is not sufficient to control TB in high HIV prevalence settings where, for example, smear-negative and extrapulmonary TB are much more common. The WHO Expanded DOTS framework for effective TB control lays out additional elements that are needed under different circumstances to bring about TB control, including collaborative TB/HIV activities, addressing drug-resistant TB and expanded involvement of the private sector. This framework has been insufficiently communicated and implemented by policy-makers and health workers. The flexibility and inclusiveness of the DOTS strategy to provide patient-centred care should be better communicated. Beyond this, the existing guidelines on the diagnosis and management of smear-negative and extrapulmonary cases of TB should be reviewed. New ways of accelerating accurate diagnosis and treatment are urgently needed in the HIV era.

Data presented from Cambodia showed that previously undiagnosed TB was detected in 15–25% of people living with HIV/AIDS (PLWHA) who were screened for TB. HIV programmes must prioritize intensified TB case-finding for PLWHA and treat latent TB infection in those who have no evidence of active TB disease.

"3 by 5" by DOTS?

The "3 by 5" initiative, which plans to put three million PLWHA on ART by the end of 2005, is an ideal opportunity to stimulate improved access to ART for HIV-infected TB patients, thus reducing morbidity and mortality. However, HIV programmes face a major challenge in transforming HIV/AIDS from a killer into a chronic disease through public provision of ART to all those in need. Such a transformation will require a strengthened HIV programme supported by strong political commitment that is able to detect a high proportion of PLWHA eligible for therapy, guarantee reliable diagnosis and drug supplies, ensure adherence to standardized treatment regimens, and be able to accurately monitor, record and report response to treatment on an individual and national basis. Clearly, the DOTS strategy can provide many lessons for ART and the "3 by 5" initiative, and TB control programmes can provide valuable assistance to HIV/AIDS programmes in setting up and manag-
ing many of these key elements in delivering treatment.

Effective collaboration between HIV/AIDS and TB control programmes in the context of “3 by 5” was demonstrated in Malawi, which is now rapidly heading towards nationwide coverage of collaborative TB/HIV activities and ARV scale-up. Regional TB officers in Malawi will be responsible for monitoring the new ART programme in the same way they monitor the recording and reporting of TB diagnosis and treatment from their respective districts. The TB officers were trained on ART delivery systems and use of the newly developed monitoring and evaluation tools that build on the cohort analysis approach of TB control. Central units of the national TB control and HIV/AIDS programmes conduct joint analysis of the data collected. HIV and TB control programmes can work effectively together to use the lessons from the DOTS strategy to achieve the ambitious “3 by 5” target.

**ART to TB patient is feasible but still a dream for most**

The high prevalence of HIV among TB patients (over 75% in some settings) indicates that TB programmes can be an important entry point for ART where high numbers of PLWHA who would be eligible for ART are already in contact with the health service. Preliminary data presented from Durban, South Africa, demonstrated that integrating ART into existing TB clinic services is feasible and improved treatment outcomes for both diseases. Similarly, joint delivery of TB and HIV services (including ART) in Khayelitsha, South Africa, benefits both patients and staff. Patients receive care for both TB and HIV in one visit and staff develop expertise in managing both diseases, while improved treatment outcomes boost staff morale. However, in reality, access to ART for HIV-infected TB patients remains very limited in most countries. In Malawi, the mismatch between TB treatment that is decentralized, down to primary health centres, and centralized hospital-based ART limits access to ART for many TB patients, especially those furthest from the hospitals. In Thylo district, only 13% of eligible HIV-positive TB patients were eventually started on ART. Decentralization of ART from hospitals to primary care would greatly improve ART access and equity.

The choice of using generic or branded drugs for ART scale-up is a country choice. There is concern, however, about establishing parallel systems for ART delivery (one generic, the other for branded drugs), particularly where multiple partners are involved. This compromises standardized treatment and drug access for patients.

**Stigma – double trouble**

HIV-infected TB patients often bear a double burden of stigma, one for TB and another for HIV. Lack of training on HIV and TB resulted in negative attitudes of service providers and further fuelled the stigma experienced by coinfected patients in Ukraine, for example. In the Russian Federation, it was reported that up to 90% of PLWHA reported stigmatization. In the United Republic of Tanzania, many HIV-infected TB patients preferred to stay at home due to fear of stigma. Provision of home-based care for TB/HIV by community volunteers from a faith-based nongovernmental organization (PASADA) in the United Republic of Tanzania was instrumental in improving the care provided to HIV-infected TB patients, including enhancing community awareness against stigma. It was particularly recognized that the double stigma poses a huge challenge in scaling up universal and high-quality HIV testing and counselling for TB patients in high-HIV prevalence settings.

**UNAIDS/WHO joint policy statement on HIV testing**

The recent UNAIDS/WHO joint policy statement on HIV testing was applauded for responding to the need for a paradigm shift in HIV testing policy. This accelerates knowledge of HIV status in those at risk and thus ensures their access to the most appropriate prevention, treatment, care and support.

The policy statement (http://www.who.int/hiv/pub/vct/en/)
Kenya is rapidly scaling up counselling and testing services and implementation of routine and diagnostic HIV testing in clinical settings. It has recently published updated guidelines on HIV testing following the joint WHO/UNAIDS policy statement that strongly support diagnostic testing.

"Failure to provide HIV testing when symptoms or signs of HIV disease may be present is sub-standard care and is not acceptable”.

**HIV testing and counselling – the door to care and prevention**

HIV testing and counselling is the doorway through which TB patients and the general population can access the most appropriate prevention, treatment and support services for TB and HIV. It was recognized, however, that ensuring nationwide universal coverage of high-quality rapid HIV testing and counselling for TB patients and the general population in high-HIV settings would be a challenge. Malawi is heading towards nationwide coverage of HIV testing for TB patients and has an ambitious plan for testing 750000 people for HIV between 2004 and end of 2005. To meet this target during the first two quarters of 2004, 240 health workers have been trained as full-time counsellors and in the use of rapid HIV testing. Furthermore, strengthening referral networks between TB, HIV, PMTCT, STI and VCT services, and establishing reliable supplies management (e.g. HIV test kits) are also crucial for rapid scale-up of HIV testing and counselling services.

**Enablers for nationwide expansion of HIV testing for TB patients**

- Availability of knowledgeable, trained and committed health workers at service delivery points.
- Availability of diagnostic HIV testing at TB service delivery points.
- Facilities conducting HIV testing in the consulting (counselling) room.
- HIV testing for TB suspects in addition to confirmed TB patients.
- HIV testing earlier in the course of TB illness.
- Increasing availability of services such as isoniazid and co-trimoxazole preventive therapies and ARV for HIV-positives.
- Increasing community awareness of the TB/HIV link and the benefits of testing.
- Participation of PLWHA in the planning and implementation of activities.
- Uninterrupted supply of HIV test kits.

**The peril of health workforce crisis: who is going to do it?**

The serious shortage of human resource capacity is a major constraint to the rapid scale-up of collaborative TB/HIV activities. The dearth of technical and administra-
tive staff throughout the health sectors of most countries affected by the dual TB/HIV epidemic needs urgent intervention. Salaries and incentives need particular attention. Key stakeholders – for example, the WHO Evidence and Information for Policy (EIP) cluster and the Rockefeller Foundation – are already working to address the issue of human resource capacity constraints, and the WG must collaborate with them to contribute and implement their recommendations for TB/HIV. Solutions should include ensuring that existing staff members are competent to carry out their tasks, and must address clinical, counselling and laboratory staff needs that need to be developed, as well as the advantages of expanding the traditional workforce to include community health workers, lay counsellors and PLWHA. These efforts should be linked with strong advocacy activities at all levels. Communities need to be involved to establish what they can contribute in terms of human resources to support scale-up. Ministries of health need to ensure that acceptable services are in place to prevent transmission of HIV and TB to health-care workers. Health-care workers should be encouraged to consider their own HIV status.

**Act up and involve the community**

The meeting benefited from much greater involvement of HIV activist and community groups, but even more effort is needed to truly engage communities in the fight against TB and HIV. Zackie Achmat, who heads Treatment Action Campaign in South Africa, spoke about the role of advocacy and activism for effective TB/HIV response. He acknowledged that much information is already available for patients and community groups to act on and help ameliorate the TB/HIV epidemic, but TB communities still do not know enough about HIV, and vice versa. Informed community groups and patient populations are critical to effective implementation of collaborative TB/HIV activities.

Governments must be held accountable to their TB and HIV/AIDS commitments made at the Millennium Summit, the UNGASS, the Abuja Summit and the World Health Assembly, and in the Amsterdam Declaration. Access to TB and HIV prevention, diagnosis and treatment services must be seen as an essential human right. Governments should be pressured to take responsibility for delivering the best TB and HIV/AIDS services available under existing circumstances. Joint delivery of TB and HIV prevention and treatment services including ART must become the standard of care and be centred on the patient.

The involvement of activists and community groups should particularly be sought to accelerate the implementation of collaborative TB/HIV activities in countries with high TB and HIV. This country-level activity should embrace building the pressure on country programmes to enhance their accountability with regard to addressing the TB/HIV epidemic.

**Costing TB/HIV activities: who is going to foot the bill?**

WHO has estimated the cost for implementing collaborative TB/HIV activities in the 34 priority countries of the “3 by 5” initiative at US$ 250 million per year. Governments and funding agencies need to be lobbied to identify the necessary funds.

---

**PLWHA activists in the TB/HIV front in Uganda**

The National Forum of PLWHA Networks in Uganda shared their experiences of an emerging TB/HIV advocacy movement from Uganda. They recognize that TB is not yet on the advocacy agenda of PLWHA and HIV is not yet fully on the agenda of the TB community, and they aim to address these gaps. Uganda has yet to develop a national policy or plan to support the implementation of collaborative TB/HIV activities and they are fighting for this. They have made a presentation to the national HIV/AIDS Partnership to educate them on the need for TB/HIV collaboration and to seek its technical, financial and moral support for collaborative activities. This PLWHA-led activity is also geared towards influencing pe-
Peripheral service providers and organizations (e.g. NGOs) to deliver joint TB and HIV services.

African Union calls for scaling-up TB/HIV activities

The WG meeting was an excellent opportunity for high-level advocacy to garner political support for collaborative TB/HIV activities both locally and internationally. Dr Jack Chow, Assistant Director-General of WHO, and Dr Julie Gerberding, Director of CDC, met with H. E. Meles Zenawi, Prime Minister of Ethiopia, to highlight the importance of TB/HIV in Ethiopia. With the appointment of a national TB/HIV coordinator, the availability of a substantial amount of resources and the initiation of activities in seven pilot sites, Ethiopia is ready to take on its scale-up of activities. These high-level dignitaries also spoke with a delegation from the African Union. The Union has recognized that HIV-related TB is a serious problem facing the continent and called for all Member States to embrace and scale up implementation of collaborative TB/HIV activities. Press conferences were conducted in Addis Ababa and Nairobi during the meeting, with wide international and national media coverage.

Experience from the field

Beyond the plenary presentations, country-level experiences in implementing collaborative TB/HIV activities were shared in an interactive forum with poster displays and moderated discussions. Presentations were made by Cambodia, the Democratic Republic of the Congo, Ethiopia, India, Kenya, Malawi, Mozambique, Nigeria, the Russian Federation, South Africa, Sudan, Thailand, the United Republic of Tanzania, Uganda, Ukraine and Zambia. They included activities run by ministries of health, partner organizations and technical agencies, NGOs and community-based organizations. Country-level implementation is accelerating but still falls short of national coverage of all the collaborative TB/HIV activities defined in the interim policy. There are no longer valid excuses for countries with a high burden of HIV-related TB not to plan to implement collaborative TB/HIV activities, particularly with clear policy recommendations and greatly increased opportunities for scaling-up through the international funding opportunities.

TB/HIV data are scarce in Europe

Eastern European nations are experiencing particularly high levels of TB and MDR-TB, and a fast-rising HIV epidemic. Such a combination is potentially disastrous for both TB control and HIV care, but there is a scarcity of data that systematically document the impact of HIV on TB in the region. TB and HIV surveillance systems and the health information system must be strengthened to inform appropriate policy and programme interventions.

Need to explore the link between HIV and MDR-TB

The worrying situation in eastern Europe offers the spectre of an HIV-fuelled epidemic of MDR-TB, which is also possible in other settings such as South Africa, where it could occur in a more localized way. Clearer definition of the extent of this lethal combination is urgently needed.

Nutritional support is important for TB/HIV care

In Cambodia, the World Food Programme provides nutritional support for TB patients. This has contributed to the improvement of TB care. Nutritional support was emphasized as a component of TB/HIV care that could improve the adherence and livelihood of HIV-infected TB patients.

Lack of national TB/HIV policies impedes activities

Weak or non-existent national policies and operational guidelines to support programme implementation in many countries impede the accelerated implementation of collaborative TB/HIV activities, particularly by NGOs and community-based organizations. Countries are urged to develop the necessary delivery, support and monitoring systems that will ensure quality delivery of services by all service providers.

Community involvement in TB/HIV care is crucial

Strengthening the role of community involvement in TB/HIV care was considered as a stepping stone to a sustainable TB/HIV care-delivery system. The role of family members, relatives, caregivers and other community supporters, including PLWHA, to deliver TB/HIV care should be explored.
Award scheme for best performing countries

It was recognized that countries with high TB/HIV burdens have different paces and interests to implement collaborative TB/HIV activities. Innovative ways need to be sought to accelerate country-level implementation. A continental or regional award scheme linked with strong advocacy efforts was suggested for countries with established track records of implementation.

Marginalized populations

It was noted that in many regions of the world, such as Asia and eastern Europe, the TB/HIV epidemic is closely linked with intravenous drug use and other marginalized populations who may have special needs in terms of collaborative TB/HIV activities. Considerations such as harm reduction and coinfection with hepatitis need to be addressed.

Improved monitoring and evaluation essential

Monitoring and evaluation (M&E) of TB/HIV activities in countries is essential for demonstrating successes, identifying problems and assessing interventions for improvement. Few countries with a high burden of TB/HIV, and weak M&E systems in place, however, are able to document their progress. Two questionnaires requesting information on collaborative TB/HIV activities in 2002 (as baseline) and 2003 were sent to the 41 highest burden TB/HIV countries, and responses were received from 34 countries. Inclusion of TB/HIV into national policies and plans, and joint planning between the HIV/AIDS and TB control programmes, are the most common activities. Implementation of TB/HIV activities is progressing, but coverage within countries remains very low. To date, few countries are able to demonstrate the number of people accessing collaborative TB/HIV activities. There is an urgent need to establish recording and reporting systems to be able to capture the newly developed TB/HIV indicators for routine programme monitoring and evaluation. WHO needs to advise on the alterations to the TB registers and reporting forms that are needed to capture TB/HIV activities for effective national and global monitoring, and evaluation. HIV care and treatment registers are being developed that incorporate the capture of information on TB/HIV indicators.

TB/HIV surveillance as an entry point for scale-up

Promoting surveillance of HIV in TB patients can be an important means for scaling up collaborative TB/HIV activities. As part of the US President’s Emergency Plan for AIDS Relief (PEPFAR), CDC has developed a TB/HIV Surveillance Initiative, which aims to assist focus countries to develop a national TB/HIV surveillance system as an entry point for scaling up collaborative TB/HIV activities. HIV surveillance among TB patients will focus on promoting a high uptake of routine diagnostic HIV testing in the TB care setting, linked to a package of care for TB patients who are found to be HIV-positive. The HIV data generated by this approach will be used for surveillance purposes. This theme was greatly expanded upon during the CDC/WHO co-organized TB/HIV surveillance meeting on 22–24 September 2004. Country TB and HIV programme managers and surveillance officers, representatives of partner organizations and in-country CDC staff were in attendance. National TB/HIV surveillance plans were developed to serve as an entry point for scaling up collaborative TB/HIV activities in nine out of the 15 PEPFAR priority countries.

Building the evidence base is a priority

Interactions between ART and TB drugs will add further challenges to collaborative TB/HIV activities in resource-limited settings. Rifampicin reduces the concentration of ARV drugs, especially protease inhibitors, and toxic reactions are much more common when TB and ARVs are used together. Important research questions include when to use both rifampicin and ARVs, whether alternatives to rifampicin (such as rifapentine) can be used to allow earlier use of ARVs in TB patients, how to support adherence, and the effect of ARVs on early TB mortality. The evidence for or against the use of preventive therapies, such as cotrimoxazole and isoniazid, once a patient is on ART is not clear. Studies exploring the interactions between ARV and TB drugs and the
utility of ART in combination with preventive therapies (IPT and CPT), for example, are urgently required. The research currently under way by the Consortium to Respond Effectively to the AIDS/TB Epidemic (CREATE) will go some way to answering many of the questions around IPT. There remains an enormous need, however, for operational research to build the evidence base and accelerate the implementation of collaborative TB/HIV activities. A meeting to set priorities in TB/HIV research is being planned for February 2005 by the Secretariat of the WG.

Marketplace for partners: information exchange

The following partner organizations shared their experience in TB/HIV activities in an interactive marketplace.

AFRICAN SERVICE COMMITTEE (ASC)
- ASC has provided HIV, STI and TB testing, care, treatment and support for African immigrants in New York City since 1991. ASC has opened a branch in Addis Ababa in 2003, which is providing free VCT, with plans to integrate collaborative TB / HIV activities in 2005.

TB/HIV RESEARCH FOUNDATION – THAILAND
- Health educational material has been developed in Chiang Rai to enhance adherence to treatment among people with TB and HIV/AIDS, based on social and behavioural studies. Patients’ stories were included in the materials as methods of addressing stigma and fatalism.

WHO EASTERN MEDITERRANEAN REGION (EMR)
- EMRO will start TB/HIV collaboration within the framework of the “3 by 5” initiative, providing VCT and ART for TB patients, and systematic TB screening and DOTS for PLWHA. After planning and training, four pilot projects will start in Sudan, Djibouti, the Islamic Republic of Iran, Morocco and Sudan in April 2005.

KNCV TB FOUNDATION
- KNCV TB Foundation aims to reduce the burden of TB and HIV in populations affected by both diseases through implementation of country-specific TB/HIV collaborative programme activities, with all KNCV partner countries implementing a national policy of TB/HIV collaborative programme activities by the end of 2005.

NUFFIELD INSTITUTE FOR HEALTH
- Introducing the “Integrated Management of Adolescent–Adult Illness” (IMAI) guidelines in health centres of Lubombo region (Swaziland) has contributed to a low ARV default rate. Community treatment supporters were the basis of the programme’s success.

WHO–HQ
- Implementation of TB/HIV collaborative activities requires training of health personnel. The HIV/AIDS and Stop TB departments of WHO headquarters conducted the first TB/HIV consultants training course in early 2004 and are developing a TB/HIV managerial course for national TB and HIV/AIDS programme managers.

WHO WESTERN PACIFIC REGION (WPR)
- WPRO assists TB/HIV activities in Cambodia and Viet Nam, including TB/HIV surveillance, screening for TB among HIV patients and use of CPT. ARV treatment and IPT are available in Cambodia but not in Viet Nam.

GLOBAL FUND TO FIGHT AIDS, TUBERCULOSIS AND MALARIA (GFATM)
- GFATM is a funding mechanism to combat the three killer diseases, including the response to abate the TB/HIV epidemic. The GFATM has approved funding for TB/HIV activities in 13 countries

PARTNERS FOR HEALTH REFORM PLUS (PHRPLUS)
- Working in Cambodia to provide VCT to TB patients with an algorithm for appropriate patient management. Coordination between TB and HIV programmes was most important for the success of this project.

INTERNATIONAL UNION AGAINST TUBERCULOSIS AND LUNG DISEASE (IUATLD)
- Planned activities in Cambodia, Democratic Republic of the Congo and Malawi include VCT, CPT, IPT and linkage with community home care and other services.

MANAGEMENT SCIENCES FOR HEALTH (MSH)
- Management and Organizational Sustainability Tool (MOST) for TB/HIV collaboration brings together stakeholders in both TB and HIV programmes to assess and make concrete plans for more effective collaboration and better use of resources.
Key Conclusions and Recommendations

RESOURCES MOBILIZATION
- The Stop TB Coordinating Board, the GFATM Board and WHO should prioritize proactive measures to remove the barriers to the rapid flow of money to countries and address barriers to translating money into activities.
- GFATM’s guidelines for proposal should stress the importance of including TB interventions in HIV proposals, and vice versa, as a requirement for successful applications from high-burden TB/HIV countries.

ADVOCACY AND ACTIVISM
- All partners working on TB/HIV are urged to engage more with community and activist groups, particularly from the HIV community, to accelerate implementation of collaborative TB/HIV activities centred on clients’ needs.
- Partnerships between activists and health-care workers should be strengthened to facilitate joint identification of advocacy challenges, constraints and solutions.
- Prioritize advocacy for new diagnostics and drugs, especially for TB, and easy, equitable access to an uninterrupted supply of good quality TB and HIV prevention, diagnostic and care services.

HUMAN RESOURCES
- Competency needs to be developed in existing staff, as well as expansion of the traditional workforce, to include community health workers, lay counsellors and PLWHA for scaling up collaborative TB/HIV activities.
- Governments should develop strategies to retain, protect and increase the number of health workforce. Other constituencies, such as ministries of finance, should be involved for salary and incentives issues.
- The International Monetary Fund and the World Bank were urged to remove any constraints to human resource capacity development.
- TB/HIV WG needs to collaborate with existing human resource capacity development efforts of partners such as WHO/EIP cluster and the Rockefeller Foundation.

COLLABORATION
- TB and HIV communities should address their differences in a way that will enable their strengths to be shared and weaknesses overcome.
- All partner organizations should increase collaboration and partnership in particular to strengthen effective utilization of resources and coordination of TB/HIV activities at country level.
- The HIV/TB task force of the HIV department at WHO HQ is an excellent development that has the potential to strengthen collaboration at all levels.

COUNTRY IMPLEMENTATION
- All partners should actively promote the implementation of collaborative TB/HIV activities in countries, and technical partners should support countries in monitoring performance.
- Countries need to urgently establish the systems to regularly and transparently monitor and evaluate their performance and ensure the best results from their TB/HIV activities.
- Countries will be required to present their progress in addressing the dual epidemics at subsequent meetings of the TB/HIV Working Group.

INTRANAVENOUS DRUG USE (IDU) AND MDR-TB
- Regional efforts to explore the link of IDU and TB/HIV and adaptation of the interim policy to include accepted harm-reduction methods and other issues specific to marginalized groups.
- The impact of HIV on transmission of MDR-TB, particularly in eastern European countries and other high MDR settings, should be assessed and addressed.

SMEAR-NEGATIVE AND EXTRAPULMONARY TB
- Improvements in the diagnosis and management of smear-negative and extrapulmonary cases of TB need to be explored and existing guidelines reviewed in the context of emerging new diagnostics.

NEW DIAGNOSTICS AND NEW DRUGS
- The Stop TB Coordinating Board, the Diagnostics and New Drugs WGs, and the technical agencies must respond to the urgent need for new diagnostics and drugs and to make potential new products rapidly available at affordable prices where they are most needed.

HIV TESTING FOR TB PATIENTS
- The operational aspects of nationwide scale-up of HIV testing for TB patients and the corresponding stigma issues should be addressed urgently.

RESEARCH PRIORITIES
- Operational research to accelerate country-level implementation and address interactions between ARV and TB drugs, and the utility of ART in combination with preventive therapies, should be prioritized.
- Working Group members and partner organizations should solicit for resources to support the TB/HIV research priorities.
LIST OF PARTICIPANTS

Photographs by H. Getahun, R. Lopez and J. van den Hombergh.

The meeting was supported by the Stop TB Partnership, the United States Agency for International Development, the US Centers for Disease Control and Prevention (CDC) and WHO.

WRITING TEAM
Written by Haileyesus Getahun and Alasdair Reid with contributions from Rafael Lopez, Pierre-Yves Norval, Paul Nunn, Rose Pray, Fabio Scano and Igor Toskin.

CHAIRS AND RAPPORTEURS
