WHY ARE ROAD TRAFFIC INJURIES A PUBLIC HEALTH ISSUE?

Road traffic injuries and deaths have a terrible impact on individuals, communities and countries. They involve massive costs to often overburdened health care systems, occupy scarce hospital beds, consume resources and result in significant losses of productivity and prosperity, with deep social and economic repercussions. The numbers speak for themselves: this is a public health and development crisis that is expected to worsen unless action is taken.

For more on: road traffic injuries

1.24 million road traffic deaths occur every year.

#1 cause of death among those aged 15-29 years

Global death figures drive home the extent of this public health crisis, especially among young people.

ROAD SAFETY AND MEDIA REPORTING

Road traffic crashes are often covered in the media simply as events—not as a leading killer of people and an enormous drain on a country’s human, health and financial resources. By framing road safety as a health and development story, with data and in-depth information, journalists have the opportunity to affect the way these stories are told and potentially to help shift public behaviour and attitudes, influence policy and therefore contribute towards saving lives.
The chance of dying in a road traffic crash depends on where you live

**INTERPRETING THE NUMBERS**
- Tallying the total number of deaths can, however, be useful for conveying the magnitude of the problem, the prevention effort required and the health care resources potentially needed.
- For comparisons between regions or countries (or within a country over time), the use of death rates per 100,000 population more accurately reflects the size of the problem than absolute numbers. Use of the total number of deaths alone can be misleading, because it leads to comparisons of populations of unequal size.

**MAGNITUDE**
- About 1.24 million people globally die each year as a result of road traffic crashes—that’s nearly 3,400 deaths a day.
- Half of those who die on the world’s roads are vulnerable road users: pedestrians, cyclists and motorcyclists.
- Road traffic injuries are the leading cause of death globally among people aged 15–29 years.
- Around the world, almost three times more men than women die from road traffic injuries.

For a broader perspective on the dimensions of road traffic deaths, this infographic provides a comparison to some of the world’s main killer diseases.

**Number of deaths 2012 (millions)**
- **1.5** AIDS-related deaths
- **1.3** Road Traffic
- **0.9** Tuberculosis
- **0.6** Malaria

*Source: GHE 2014*

**3 out of 4 road deaths are among men**

- Five key risk factors in road traffic deaths and injuries are: drinking and driving, speeding and failing to use motorcycle helmets, seat-belts and child restraints.
- Over 90% of the world’s road traffic fatalities occur in low- and middle-income countries, even though these countries have only about half the world’s vehicles.
- Without action, annual road traffic deaths are predicted to increase to around 1.9 million by 2030 and to become the seventh leading cause of death.
ECONOMIC COSTS

Road traffic crashes cause not only grief and suffering but also economic losses to victims, their families, communities and nations as a whole, costing countries on average 3% of their gross national product. Indirect costs, such as loss of productivity, damage to vehicles and property, reduced quality of life and other factors, must also be included in calculating the true cost to society.

Note: A variety of methods are used in costing studies at country level; they therefore don’t necessarily provide a solid basis for global comparisons. Nevertheless, at country level, they serve to highlight the impact of road traffic crashes on different sectors and help to convince policymakers to invest in prevention.

THE GLOBAL STATUS REPORT ON ROAD SAFETY

“With the Global status report on road safety, we have an assessment on the status of road safety around the globe. This unique and comparable set of data confirms the relevance of this issue to the societal challenges of today.”
WHO Director-General, Dr Margaret Chan, 2013

Approximately every 2 years, WHO produces a new Global status report on road safety (GSRRS). The 2013 report:

- presents information from 182 countries and includes country profiles and a statistical annex;
- uses a standardized method, so that comparisons can be made between countries and in the same country over time;
- analyses how effectively countries are implementing road safety measures and whether they have a national strategy with targets to reduce road traffic deaths and injuries;
- examines the five main risk factors; and
- concludes that, as legislative change and enforcement are key to reducing fatalities, the pace of legislation change must accelerate. Only 28 countries in the world have comprehensive road safety laws to address the five main risk factors.

VULNERABLE ROAD USERS

- Reducing road traffic deaths requires paying more attention to the needs of pedestrians, cyclists and motorcyclists, who have so far been largely neglected in transport and planning policies.
- By putting in place measures to increase safe walking and cycling, governments can also reduce air pollution, greenhouse gas emissions and traffic and achieve better health resulting from more physical activity.

50% of all road traffic deaths are among motorcycles, pedestrians, and cyclists.

A ROAD SAFETY SUCCESS STORY

"Political will is needed at the highest level of government to ensure appropriate road safety legislation and stringent enforcement of laws by which we all need to abide. If this cannot be ensured, families and communities will continue to grieve, and health systems will continue to bear the brunt of injury and disability due to road traffic crashes."

WHO Director-General, Dr Margaret Chan, 2013

CASE STUDY: THE NETHERLANDS

For decades, the Netherlands has made great strides in reducing pedestrian fatalities and injuries on the nation’s roads. Road design measures such as construction of 30 km/h zones and raised, highly visible, uniform crossings; vehicle measures such as pedestrian-friendly car fronts; and information and education on behavioural measures such as those related to drinking and driving and speeding have increased the safety of pedestrians. Paying particular attention to the specific needs of children and the elderly has also contributed to a decline in pedestrian fatalities and injuries.

The citizens of the Netherlands have accepted and supported the notion of a culture of safety, and the progress in protecting pedestrian lives is evidence of an overall focus on safety throughout society.
