CHRONIC DISEASES ARE THE MAJOR CAUSE OF DEATH AND DISABILITY WORLDWIDE

**Facts:**
- In Japan, chronic diseases accounted for 80% of all deaths in 2002 (see chart, right).
  - Total deaths in Japan, 2002 = 973,000.
  - Total deaths due to chronic disease in Japan, 2002 = 784,000.

**Note:**
The data presented in this information sheet were estimated by WHO using standard methods to maximize cross-country comparability. They are not necessarily the official statistics of WHO Member States.

**Deaths by cause, all ages, Japan, 2002**

- Cardiovascular disease: 31%
- Cancer: 32%
- Other chronic diseases: 11%
- Chronic respiratory disease: 5%
- Diabetes: 1%
- Other chronic, maternal and perinatal, nutritional deficiencies: 12%
- Injuries: 8%
**Projected prevalence of overweight, Japan, males and females aged 30 years or more, 2005 and 2015**

**Facts:**
- Raised body mass index (overweight and obesity) is an important cause of chronic disease.
- Prevalence of overweight in Japan is expected to increase in men over the next 10 years, while prevalence of overweight in women is projected to decrease (see charts, left).

**Solutions:**
- At least 80% of premature heart disease, stroke and type 2 diabetes, and 40% of cancer could be prevented through healthy diet, regular physical activity and avoidance of tobacco products.
- Cost-effective interventions exist, and have worked in many countries: the most successful strategies have employed a range of population-wide approaches combined with interventions for individuals.
