COVID-19: TOBACCO USE AND VAPING

SMOKING
Smoking cigarettes/bidis/kreteks/sheesha and other forms of smoking products can increase your chances of getting COVID-19 by:

Transferring the virus by bringing your hands to your mouth

Smoking damages lungs, heart and other body parts and may increase your risk of getting a severe case of COVID-19.

VAPING
Vaping makes lungs more vulnerable to infection and disease. It also weakens the immune system.

SHEESHA
Sharing tobacco products such as waterpipe/sheesha/hukka can transmit the virus between people.

The sheesha apparatus (including the hose and chamber) itself may contribute to this risk by providing an environment that promotes the survival of the virus outside the body, as it is not cleaned often in social and community settings.

SMOKELESS TOBACCO AND BETEL NUT CHEWING
Chewing smokeless tobacco (khaini, zarda, gutka, paan and paan masala with tobacco) and areca nut (supari) increase saliva production and enhances the urge to spit repeatedly.

Spitting in public places could increase the spread of COVID-19.

QUIT NOW – IT IS NEVER TOO LATE TO QUIT!
