**Virological Surveillance Summary**

The total number of specimens and number of positive specimens reported to FluNet by Western Pacific Region countries and areas between week 1 2020 and week 5 2020 are presented in the table below. Influenza A and B are cocirculating in the region, with influenza A (H3) predominating however in recent weeks the proportion of A(H3) reported has increased (Figure 1). It should be noted that several countries and areas have not reported in 2020.

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient sentinel indicator based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted and information is available.

The WHO surveillance case definition for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of $\geq 38^\circ C$ and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of $\geq 38^\circ C$ and cough, with symptom onset within 10 days that requires hospitalization. Sentinel site data should be interpreted with caution since the number of sites reporting may vary between weeks.

Countries in the temperate zone of the Northern Hemisphere

In countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity increased slightly earlier than in previous seasons in China and Japan.

Outpatient ILI Surveillance

**China (North)**

During week 5 2020, the percentage of visits for ILI at national sentinel hospitals in Northern China was 8.5%, higher than the last week (6.8%), and higher than the same week of 2017-2019 (3.6%, 4.2% and 4.5%) (Figure 2).

**Mongolia**

During week 5 2020, ILI activity in Mongolia was lower than the previous week and remained above the upper tolerance limits (Figure 3).

(Source: China National Influenza Center)

**Figure 3: Proportion of outpatient ILI visits per 10,000 people in Mongolia, 2017-2020**

(Source: Mongolia National Influenza Center)
Republic of Korea
In week 5 2020, the overall weekly ILI rate was 28.0 ILI cases per 1,000 outpatient visits, slightly lower than the previous week with 40.9 ILI cases per 1,000 outpatient visits. The peak this year is lower than 2016-2019 (Figure 4).

Sentinel influenza surveillance
Japan
In week 3 of 2020, influenza sentinel hospital activity in Japan was lower than the previous week and is lower than previously reported seasonal levels (Figure 5).
Countries/areas in the tropical zone
ILI and influenza activity continued to increase in most of the countries and areas.

Surveillance

Hong Kong SAR (China) – ILI and hospital Surveillance
In week 5 2020, the average consultation rate for ILI among sentinel general outpatient clinics was 4.5 ILI cases per 1,000 consultations, which was lower than 6.7 ILI cases per 1,000 consultations recorded in the previous week and lower than the same week of the previous year (Figure 6). The average consultation rate for ILI among sentinel private medical practitioners was 20.5 ILI cases per 1,000 consultations, which was higher than 15.5 recorded in the previous week and lower than previous years, 2016 - 2019 (Figure 7).

China (South) - ILI Surveillance
During week 5 2020, the percentage of visits for ILI at national sentinel hospitals in Southern China was 8.0%, higher than the previous week (7.4%), higher than the same week of 2017-2019 (3.5%, 5.1%, and 5.1%). ILI activity increased slightly earlier compared with previous seasons (Figure 8).

Singapore – Acute Respiratory Infection (ARI) Surveillance
In week 5 2020, the average daily number of patients seeking treatment in polyclinics for ARI was 4,728 over 4.5 working days, which is higher than the previous week and the same time period in 2019 (Figure 9).
Lao PDR (No update)

In week 2 2020, the number of ILI cases presenting to sentinel sites was slightly increased compared to the previous week and slightly higher than the same period of previous year (Figure 10).

Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity is reported during the influenza season usually starting in May in Australia and New Zealand.

Australia – Laboratory-confirmed influenza and ILI (No update)

In week 40, there were 3.9 ILI per 1,000 consultations at sentinel general practitioners, decreasing from the seasonal high of 13.3 per 1,000 consultations in week 28 and lower than the 5 year average for this time of year. There have been 298,120 laboratory-confirmed cases of influenza reported to the National Notifiable Diseases Surveillance System. While number of cases was slightly lower than the five year average, there has been a marked decrease in notifications per week following a peak in week 27 and now showing a weekly trend similar to that seen in past years (Figure 11).

![Figure 11: Australian notifications of laboratory confirmed influenza](source: National Notifiable Diseases Surveillance System, Australian Department of Health)
New Zealand – Influenza like Illness (No update)

There were 4 general practice visits for Influenza-like Illness per every 100,000 registered patients followed in New Zealand during the week ending 29 September. General Practice visits for influenza-like illness are well below the baseline level in the week ending 29 September, with a decrease compared to the previous week (Figure 12).

![Figure 12: Weekly General Practice ILI Rates in New Zealand](source)

Pacific Island Countries and Areas (PICs) - ILI Surveillance

In the Pacific Island Countries and Areas, in week 5 2020, the number of ILI cases reported increased in several PICs, including in Cook Islands, Fiji, and Vanuatu (Figure 13).
