Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by Western Pacific Region countries and areas between week 1 and week 39 of 2022 are presented in Table 1 below. Influenza A and B are co-circulating, however, the majority of cases reported from week 1 to week 39 2022 have been Influenza A (Figure 1). Caution should be taken when interpreting these data as there are reporting delays.

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient indicator based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted and information is available.

The [WHO surveillance case definition](https://www.who.int) for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within 10 days that requires hospitalization. Sentinel site data should be interpreted with caution since the number of sites reporting may vary between weeks.

Countries in the temperate zone of the Northern Hemisphere

In countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity is similar to the corresponding period from previous years.

Outpatient ILI Surveillance

**China (North)**

During week 38 of 2022, the percentage for ILI at national sentinel hospitals in northern provinces of China was 2.5%, same as last week (2.5%), higher than the same week of 2019-2021 (2.2%, 2.2% and 2.2%) (Figure 2).

![Figure 2: Percentage of visits for ILI at sentinel hospitals in Northern China, 2019-2022](Source: China National Influenza Center)
**Mongolia**
During week 37 of 2022, the ILI activity in Mongolia increased to 53 ILI cases per 10,000 population. This is higher than the upper tolerance limit of 20 ILI cases per 10,000 population (Figure 3).

![Figure 3: Proportion of outpatient ILI visits per 10,000 people in Mongolia, 2020-2022](Source: Mongolia National Influenza Center)

**Republic of Korea**
In week 39 of 2022, the overall weekly ILI rate was 4.9 ILI cases per 1,000 outpatient visits, which was slightly higher than previous week (4.7). The ILI consultation rate has remained below the national epidemic threshold (5.8 ILI cases per 1,000 outpatient visits) and absence of seasonal peaks since week 10 of 2020 (Figure 4).

![Figure 4: Weekly ILI incidence rate per 1,000 outpatient consultations, Republic of Korea, 2017-2022](Source: Korean Centres for Disease Control and Prevention)
Sentinel influenza surveillance

**Japan**

In week 38 of 2022, the number of cases reported weekly by sentinel hospital sites remained very low in Japan. The number of cases in 2022 has been consistently low (Figure 5).

![Figure 5: Number of influenza cases reported weekly per reporting sentinel hospital site, Japan 2012-2022](Source: Japan National Institute of Infectious Diseases)

Countries/areas in the tropical zone

ILI and influenza activity is similar to the corresponding period from previous years in some of the countries and areas in the tropical zone.

**Hong Kong SAR (China) – ILI and hospital Surveillance**

In week 39 of 2022, the average consultation rate for ILI at sentinel general outpatient clinics (GOPC) was 0.3 ILI cases per 1,000 consultations, which was the same as 0.3 reported in the previous week (Figure 6). The average consultation rate for ILI among sentinel private medical practitioner (PMP) clinics was 16.1 ILI cases per 1,000 consultations, which was higher than 13.7 recorded in the previous week (Figure 7).
Bi-weekly Influenza Situation Update
05 October 2022

**China (South) - ILI Surveillance**
During week 38 of 2022, the percentage of visits for ILI at national sentinel hospitals in Southern China was 3.2%, lower than the last week (3.4%), the same as the same week of 2019 (3.2%), lower than the same week of 2020-2021 (3.4% and 3.6%) (Figure 8).

**Singapore – Acute Respiratory Infection (ARI) Surveillance**
In week 38 of 2022, the average daily number of patients seeking treatment in polyclinics for ARI was 2,516 higher than the previous season in 2021 (Figure 9). The proportion of patients with influenza-like illness (ILI) among the polyclinic attendances for ARI is 0.8. Of 876 samples tested for influenza in the past 4 weeks, the positivity rate in the community was 21.9%. Of the 162 specimens tested positive for influenza in August 2022, 155 were positive for Influenza A(H3N2) (95.7%) and five samples positive for Influenza A(pH1N1) (3.1%) and two were positive for Influenza B (1.2%) (Figure 10).
Lao PDR
During week 38 of 2022, the influenza activity has similar presented to sentinel sites compared to the previous week. There were 144 samples tested for influenza in week 38, 2022. Of these, 49 samples tested positive for influenza, including 15 cases for Influenza B Victoria and 34 cases for Flu A/H3 (Figure 11).

Cambodia
In week 38 of 2022, Ministry of Health received data from all seven-sentinel sites in Cambodia. The number of ILI cases decreased in Cambodia slightly decreased in week 38 of 2022 (95 cases) compared to week 37 of 2022 (120 cases) (Figure 1). However, the influenza positive rate increased significantly in this week 38 of 2022 (46.15%) compared to last week (week 37 of 2022) (17.65%). (Figure 12).
Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity is reported during the influenza season, usually starting in May in Australia and New Zealand.

**Australia – Laboratory-confirmed influenza**

In the year to date, there have been 224,565 notifications reported to the National Notifiable Diseases Surveillance System (NNDSS) in Australia, of which 818 notifications had a diagnosis date this fortnight. The weekly number of notifications of laboratory-confirmed influenza in 2022 has decreased to below the weekly 5 year average since mid-July. (Figure 13).
New Zealand – Influenza like Illness

Overall, based on multiple sources of surveillance information, community ILI activity has plateaued following a decline since mid-August (Figure 14). Activity is lower than historical rates for this time of the year and has declined over the past few weeks to 23 September 2022.
Pacific Island Countries and Areas (PICs) - ILI Surveillance

In week 38, 2022, only 10 out of 18 PICs reported the data and showed low levels of influenza-like illness activity continue to be reported across the Pacific Island Countries and Areas except for FSM, CNMI, Tonga, Samoa, Vanuatu, Wallis and Futuna, Tuvalu and Solomon Islands. (Figure 15).
Caution should be taken in interpreting these data as there may be changes in the number of sentinel sites reporting to the Pacific Syndromic Surveillance System.

** FSM: Federated States of Micronesia, CMNI: Commonwealth of Northern Mariana Islands
