A. General Context

Typhoid outbreak in Harare City reported since 10 October 2011 continues.

No report of outbreaks of malaria, cholera and measles during week 50 countrywide.

No report of Pandemic Influenza A (H1N1) cases were reported this year.

Several outbreaks reported in the Southern Africa Region: Meningococcal meningitis in South Africa, cholera in DRC and Malawi and suspected H1N1 cases in Namibia.

B. Epidemic prone diseases

Typhoid outbreak in Harare City

Harare City has been affected by an outbreak of Typhoid since 10 Oct 2011. This week, a total of 14 new typhoid cases were reported: 5 Dzivaresekwa, 1 Waterfalls, 1 Houghton Park, 1 Glen view, 1 Sunningdale, 1 Marlborough, 1 Epworth, 2 Mufakose and 1 Kuwadzana.

As of week 50 a cumulative 867 cases and 1 death (CFR= 0.12%) were reported. Northern-Western District of Harare City is the most affected with Dzivaresekwa 3 suburb reporting majority of cases.

NB: Verified cases for week 49 were 853 not 781

Figure 1: Harare Typhoid Epidemic Curve: 10 October to 12 December 2012

Anthrax

One case of anthrax was reported from Gokwe North district. No new cases were reported from Kanyemba in Muzarabani district and Dotito in Mt Darwin District. The cumulative cases are now 126 and 0 deaths.

Figure 2: Mt Darwin Anthrax Epicurve : 7 Nov-9 Dec 2012
C. Completeness and timeliness of the National data

National completeness reported for Week Number 50 decreased from 59% to 51% whilst timeliness also decreased from 57% to 51%.

*Note: Mash Central province did not report.*

D. Events of public health importance within SADC

As of 7 December the following outbreaks were reported:
1. Cholera: Cameroon, Mauritania, Nigeria, Chad, Republic of Congo, DRC, Burkina Faso, Benin and Niger
2. Yellow Fever: Cameroon and Ghana
3. Lassa Fever: Chad
4. No updates received on:
   - Cholera outbreaks in Malawi
   - H1N1 in Namibia
   - Meningococcal disease in South Africa

E. Acknowledgements

All health workers, operating at different levels of the health system, providing information are greatly acknowledged. In addition, special thanks to the members of Health and WASH clusters for sharing their data with our team.

MOHCW is grateful to all Partners including UN family and NGOs for their support.

Information on events of public health importance occurring within SADC is consolidated from the WHO daily summary of health events.
Annex 1: Classification of Events that may constitute a Public Health Emergency of International Concern

There are three groups of events if detected by the national surveillance system should trigger the use of the IHR (2005) Decision Instrument to be notified as they may constitute Public Health Emergencies of International Concern. These are:

1. A case of unusual or unexpected diseases which may have serious public health impact: smallpox, poliomyelitis due to wild-type poliovirus, human influenza caused by a new subtype and SARS.

2. Any events of potential international public health concern including events of unknown causes or sources and those involving other events or diseases:
   - environmental health emergencies (natural events, technological incidents, complex emergencies and deliberate events)
   - chemical risk in food (environmental or intentional pollution)
   - Zoonotic diseases or other infectious diseases.

3. Any of following diseases that have demonstrated the ability to cause serious public health impact and spread rapidly and internationally: Cholera, pneumonic plague, yellow fever, viral haemorrhagic fevers, West Nile Fever, other diseases that are of special national or regional concern e.g. dengue, RVF and meningococcal disease.
### Annex 2: Standard Case Definitions

<table>
<thead>
<tr>
<th>Diseases</th>
<th>Standard Case Definitions</th>
</tr>
</thead>
</table>
| **Cholera**    | **Suspected case**  
- In an area where there is no cholera outbreak, any person aged five years or more, with severe dehydration or death from acute watery diarrhoea  
- In an area where there is a cholera outbreak, any person aged two years or more presenting with acute watery diarrhoea, with or without vomiting  

**Confirmed case**  
A suspected case in which *Vibrio cholerae* sero-groups O1 or O139 has been isolated in the stool.  

**Note**  
- All suspected cases under the age of two years must be confirmed.  
- The inclusion of all ages in the case definition somewhat reduces specificity, that is, inclusion of more non-cholera childhood diarrhoea cases (mainly those below 5 years). It does not impede meaningful interpretation of trends. Teams should monitor any shift in the age distribution of cases, which might indicate a changing proportion of non-cholera cases among patients seen. |
| **Malaria**    | **Suspected uncomplicated malaria**  
Any person living in a malaria area or history of travelling in a malaria area within the last 6 weeks, presenting with fever, malaise, chills, and rigors, without signs of severe disease such as vital organ dysfunction  

**Confirmed uncomplicated malaria**  
Is suspected uncomplicated malaria with laboratory diagnosis by malaria blood slide or RDT for malaria parasites  

**Confirmed severe malaria**  
A patient hospitalized with *P. falciparum* asexual parasitaemia as confirmed by laboratory tests with accompanying symptoms of severe disease (vital organ dysfunction) |
| **Typhoid**    | **Suspected case**  
Any person with gradual onset of steadily increasing and then persistently high fever, chills, malaise, headache, sore throat, cough, and, sometimes, abdominal pain and constipation or diarrhoea  

**Confirmed case**  
A suspected case confirmed by isolation of *Salmonella typhi* from blood, bone marrow, bowel fluid or stool |
| **Diarrhoeal** | **Suspected case**  
Passage of 3 or more loose or watery stools in the past 24 hours with  
- or without dehydration **or**  
- some dehydration and two or more of the following signs: restlessness, irritability, sunken eyes, thirsty, skin pinch goes back slowly, **or**  
- severe dehydration and two or more of the following signs: lethargy or unconsciousness; sunken eyes; not able to drink or drinking poorly; skin pinch goes back very slowly  

**Confirmed case**  
Suspected case confirmed with stool culture for a known enteric pathogen.  

**Note**  
Laboratory confirmation of specific agent causing outbreak is not routinely recommended for surveillance purposes. |
### Annex 3: Alert/Action Epidemic Thresholds for selected epidemic prone diseases and other diseases of public health importance in Zimbabwe

<table>
<thead>
<tr>

Zimbabwe Weekly Epidemiological Bulletin

Notes
An alert threshold suggests to health workers that further investigation is needed. Health workers respond to an alert threshold by:

- Reporting the suspected problem to the next level
- Reviewing data from the past
- Requesting laboratory confirmation to see if the problem is one that fits a case definition
- Being more alert to new data and the resulting trends in the disease or condition
- Investigating the case or condition
- Alerting the appropriate disease-specific programme manager and district epidemic response team to a potential problem.

An epidemic/action threshold triggers a definite response. Possible actions include communicating laboratory confirmation to affected health centres, implementing an emergency response, community awareness campaign, or improved infection control practices in the health care setting.

Reporting

- T1 for notification of an infectious notifiable disease (used for up to five cases after which line lists must be filled)
- Weekly Rapid Disease Notification Form
- Reporting is to the next level (health facility to district to province to national level)
