The following standard list of sub-sectors and health services is used for all data collection, recording and analysis purposes including HeRAMS, the IRA and other assessments (see sections 3.2, 3.3, 3.4), and for gap identification and planning (see sections 4.1 and 5.1). The list of sub-sectors is also used in the OCHA-managed 4W database.

### ESTIMATING MORTALITY RATES

To be able to compare mortality rates over time in the same population, or among different populations, ‘death counts’ must be converted into rates using a standard population denominator and a standard time period. Mortality rates are expressed in one of two ways, depending on the situation:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Usual frequency of data collection</th>
<th>Calculation of mortality rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>acute emergency period</td>
<td>each day, or every few days</td>
<td>Deaths/10 000/day</td>
</tr>
<tr>
<td>when the health situation has stabilized</td>
<td>once-a-month</td>
<td>Deaths/1000/month</td>
</tr>
</tbody>
</table>

N.B. In many situations, only a rough estimate is available for the total population and there may be ongoing population movements with high rates of in- and out-displacement. The denominator is then uncertain and changing. In such cases, calculate the mortality rate using the average (arithmetic mean) of the population estimates during the time period concerned.

---

### Additional guidance
