This report was printed on recycled milk and juice cartons. The entire paper production process incorporates sustainability objectives. Few chemicals are used, water is reused and the use of electricity is kept to a minimum.
From longstanding to emerging hazards, environmental factors are a root cause of a significant burden of death, disease and disability - globally and particularly in developing countries. They range from poor water quality and access, vector-borne disease and air pollution to toxic chemical exposures, climate change and degraded urban environments. The resulting impacts are estimated to cause over 25% of death and disease globally, reaching nearly 35% in regions such as sub-Saharan Africa (1). Much of this burden rests upon the shoulders of the poor and vulnerable.

Many of these deaths are avoidable and much of this disease is preventable. However, effective action requires renewed moral commitment to sustainable development and determined political action through international and national partnerships. Together we must translate our global knowledge-base on environment and health linkages into practical policy tools and action at the country level, incorporating environment and health considerations into social, economic and political decisions.

Simple and cost-effective solutions can best be implemented when potential impacts are considered early in the policy process -- rather than after environmental damage has occurred, health problems have emerged and human lives cut short or damaged. This requires an inclusive approach to the problems. For too long, the vicious cycle of unsustainable development, ecosystem degradation, poverty and ill health has been addressed sectorally, from a crisis management and curative perspective, rather than multisectorally and through preventive strategies.

In response to the urgent need for a more coherent and proactive policy agenda, the World Health Organization (WHO) and the United Nations Environment Programme (UNEP) joined forces at the 2002 World Summit on Sustainable Development (WSSD) to launch the Health and Environment Linkages Initiative (HELI). Sponsored by the Government of Canada and supported by the United States Environment Protection Agency, the World Health Organization (WHO) and the United Nations Environment Programme (UNEP) resources available.

No initiative is a panacea or a "one-fix" solution. However, by linking scientific knowledge to its application in a demand-driven approach and by working directly with country-level policy-makers from a wide range of sectors, UNEP and WHO can catalyse the design of more complementary environment, social and economic policies.

Our country partners share our conviction that it is time to adopt a more proactive approach to environment and health decision-making, addressing the root causes of much disease rather than the symptoms alone. Together, we want to demonstrate that such an approach makes good public policy sense, that in the broader and long-term perspective: what is good for the environment can be good for health and good for development.

With less than a year of implementation behind us, an inclusive process is now well under way and gaining momentum. We are very pleased to share this report on the initial findings and results of HELI’s activities and pilot projects, reflecting both the achievements and the challenging work still ahead.

A product of the partnership spirit of Johannesburg, HELI is an example of effective cooperation and action at international, regional and country levels. It combines the talents of WHO and UNEP in a targeted approach to policy-makers. We invite others to join us, strengthening health and environment linkages in policy-making, as part of our common response to the implementation imperative posed by the World Summit on Sustainable Development and the United Nations Millennium Development Goals.

The WHO/UNEP HELI initiative is funded by Health Canada and Environment Canada.
Health and Environment Linkages Initiative - HELI

HELI is a global effort by WHO and UNEP to promote and facilitate action in developing countries to reduce environmental threats to human health, in support of sustainable development objectives. HELI supports a more coherent approach to valuing the services that ecosystems provide to human health as part of decision-making processes. Activities include:

- Projects at country level bringing together diverse government and civil society sectors to assess and recommend integrated policies on environment and health issues.
- Guidance on better use of impact assessment and economic valuation to enhance environment and health decision-making.
- Improving access to policy-relevant knowledge, resources, and tools, via electronic media and printed materials, in priority areas. These include: water quality, availability and sanitation; water-related vector-borne diseases; ambient and indoor air quality; toxic substances; and global environmental change.
- Capacity building for policy action at local, national and regional levels through technical workshops and interactive events including policy-makers, scientists and the public.

“Human beings are at the centre of concern for sustainable development. They are entitled to a healthy and productive life in harmony with nature.”

*Principle 1 of the Rio Declaration on Environment and Development, 1992*
