Influenza B Victoria lineage cell culture-derived candidate vaccine viruses for development and production of vaccines for use in the 2019-20 northern hemisphere influenza season

Human influenza virus isolation using a certified cell line (eg MDCK 33016 PF, NIID-MDCK) has been performed by WHO Collaborating Centres (CCs) of the WHO Global Influenza Surveillance and Response System (GISRS). The WHO CCs also perform antigenic and genetic analysis on the cell cultured Candidate Vaccine Viruses (ccCVVs) as indicated. Unless otherwise noted these ccCVVs have passed two-way haemagglutination inhibition (HI) tests against the cell culture propagated prototype viruses matching the WHO recommendation. **No other testing (including adventitious agents) has been performed on these ccCVVs by the WHO CCs.** National or regional control authorities generally approve the manufacture, composition and formulation of influenza vaccines used in each country. Manufacturers should consult appropriate national or regional control authorities regarding the suitability of these ccCVVs for influenza vaccine production.

a Derived from MDCK cell line approved for use for human vaccine manufacture in compliance with Ph. Eur. general chapter 5.2.3 by Novartis/Seqirus

b Derived from MDCK cell line developed by the National Institute of Infectious Diseases (NIID), Japan

21 February 2019

Cell culture-based candidate vaccine viruses (ccCVVs), antigenically like B/Colorado/06/2017
