First of all thank you for the GAPPA. According the variety of evidence there is a dos -response relationship between physical activity and NCDs prevention and dally, so the main focus of GAPPA is on the improving physical activity regardless of the intensity. I think we need know more detail about the Physical activity intensity specially in creating active lives. Secondly; One hundred million people more active by 2030 is the goal of GAPPA, It seems that the goal need to explain and describe more clearly. I propose the 10- 15 % increased physical activity globally that is very close to NCDs prevention programs. Also, In today's world, cyberspace and virtual social networking can play an important role in awareness and advocacy for active society. Therefore, it is suggested that special attention should be paid to using this capacity.

Best regards
