Figure 8.7 In most of the 29 countries, FGM/C is less common among adolescent girls than middle-aged women

Percentage of girls aged 15 to 19 years and women aged 45 to 49 years who have undergone FGM/C

Notes: Confidence intervals for Sierra Leone could not be calculated since the prevalence among girls aged 15 to 19 has been adjusted, as explained in endnote 156. Confidence intervals for Yemen could not be calculated since access to the dataset is restricted. Country names are coloured according to prevalence level groupings, as explained in Box 4.4 on page 27.
