Progress on Drinking Water, Sanitation and Hygiene

2017
Update and SDG Baselines
The WHO/UNICEF Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (JMP) has produced regular estimates of national, regional and global progress on drinking water, sanitation and hygiene (WASH) since 1990. The JMP service ‘ladders’ enable benchmarking and comparison of progress across countries at different stages of development. This 2017 report introduces updated water and sanitation ladders which build on established indicators and establish new rungs with additional criteria relating to service levels. A third ladder has also been introduced for hygiene. The JMP will continue to monitor all rungs on each ladder, with a particular focus on those that relate to the Sustainable Development Goal (SDG) global targets and indicators.

1. Highlights

Updated JMP ladders for drinking water and sanitation and a new ladder for hygiene

Global goals, targets and indicators for drinking water, sanitation and hygiene

Updated JMP service ladders

Fig. 1 Updated JMP service ladders
Key messages
In 2015,
1. 71 per cent of the global population (5.2 billion people) used a safely managed drinking water service; that is, one located on premises, available when needed and free from contamination.
2. Estimates for safely managed drinking water were available for 96 countries (representing 35 per cent of the global population), and for four out of eight SDG regions.
3. One out of three people using safely managed drinking water services (1.9 billion) lived in rural areas.
4. Eight out of ten people (5.8 billion) used improved sources with water available when needed.
5. Three out of four people (5.4 billion) used improved sources located on premises.
6. Three out of four people (5.4 billion) used improved sources free from contamination.
7. 89 per cent of the global population (6.5 billion people) used at least a basic service; that is, an improved source within 30 minutes’ round trip to collect water.
8. 844 million people still lacked even a basic drinking water service.
9. 263 million people spent over 30 minutes per round trip to collect water from an improved source (constituting a limited drinking water service).
10. 159 million people still collected drinking water directly from surface water sources, 58% lived in sub-Saharan Africa.

By 2015, 181 countries had achieved over 75% coverage with at least basic drinking water services

* Insufficient data to estimate safely managed services.
Key messages

In 2015,

1. 39 per cent of the global population (2.9 billion people) used a safely managed sanitation service; that is, excreta safely disposed of in situ or treated off-site.

2. Estimates for safely managed sanitation were available for 84 countries (representing 48 per cent of the global population), and for five out of eight SDG regions.

3. Two out of five people using safely managed sanitation services (1.2 billion) lived in rural areas.

4. 27 per cent of the global population (1.9 billion people) used private sanitation facilities connected to sewers from which wastewater was treated.

5. 13 per cent of the global population (0.9 billion people) used toilets or latrines where excreta were disposed of in situ.

6. Available data were insufficient to make a global estimate of the proportion of population using septic tanks and latrines from which excreta are emptied and treated off-site.

7. 68 per cent of the global population (5.0 billion people) used at least a basic sanitation service.

8. 2.3 billion people still lacked even a basic sanitation service.

9. 600 million people used a limited sanitation service; that is, improved facilities shared with other households.

10. 892 million people worldwide still practised open defecation.

By 2015, 154 countries had achieved over 75% coverage with basic sanitation services

Key messages

In 2015,
1. 70 countries had comparable data available on handwashing with soap and water, representing 30 per cent of the global population.
2. Coverage of basic handwashing facilities with soap and water varied from 15 per cent in sub-Saharan Africa to 76 per cent in Western Asia and Northern Africa, but data are currently insufficient to produce a global estimate, or estimates for other SDG regions.
3. In Least Developed Countries, 27 per cent of the population had basic handwashing facilities with soap and water, while 26 per cent had handwashing facilities lacking soap or water. The remaining 47 per cent had no facility.
4. In sub-Saharan Africa, three out of five people with basic handwashing facilities (89 million people) lived in urban areas.
5. Many high-income countries lacked sufficient data to estimate the population with basic handwashing facilities.

A substantial acceleration is needed to end open defecation by 2030

Between 2000 and 2015, the number of people practising open defecation declined from 1229 million to 892 million, an average decrease of 22 million people per year. As shown in Figure 9, progress will need to accelerate in order to end open defecation by 2030.

All SDG regions saw a drop in the number of people practising open defecation, except for sub-Saharan Africa, where high population growth led to an increase in open defecation from 204 to 220 million, and in Oceania, where open defecation increased from 1 to 1.3 million.
In 2015,
- 71 per cent of the global population (5.2 billion people) used a **safely managed** drinking water service; that is, one located on premises, available when needed and free from contamination.
- Eight out of ten people (5.8 billion) used improved sources with **water available when needed**.
- Three out of four people (5.4 billion) used improved sources **located on premises**.
- Three out of four people (5.4 billion) used improved sources **free from contamination**.
- 844 million people still lacked even a **basic drinking water service**.
- 263 million people spent over 30 minutes per round trip to collect water from an improved source (**limited drinking water service**).
- 159 million people still collected drinking water directly from **surface water sources**, 58% lived in sub-Saharan Africa.

In 2015,
- 39 per cent of the global population (2.9 billion people) used a **safely managed** sanitation service; that is, excreta safely disposed of in situ or treated off-site.
- 27 per cent of the global population (1.9 billion people) used private sanitation facilities connected to sewers from which **wastewater was treated**.
- 13 per cent of the global population (0.9 billion people) used toilets or latrines where excreta were **disposed of in situ**.
- Available data were insufficient to make a global estimate of the proportion of population using septic tanks and latrines from which excreta are **emptied and treated off-site**.
- 2.3 billion people still lacked even a **basic sanitation service**.
- 600 million people used a **limited sanitation service**.
- 892 million people worldwide still practised **open defecation**.

In 2015,
- 70 countries had comparable data available on handwashing with soap and water, representing 30 per cent of the global population.
- Coverage of **basic handwashing** facilities with soap and water varied from 15 per cent in sub-Saharan Africa to 76 per cent in Western Asia and Northern Africa, but data are currently insufficient to produce a global estimate, or estimates for other SDG regions.
- In Least Developed Countries, 27 per cent of the population had basic handwashing facilities with soap and water, while 26 per cent had handwashing facilities lacking soap or water. The remaining 47 per cent had no facility.
- In sub-Saharan Africa, three out of five people with basic handwashing facilities (89 million people) lived in urban areas.
- Many high-income countries lacked sufficient data to estimate the population with basic handwashing facilities.
